

Emergency Response Guide

2025.07
ERG300E

TOYOTA MOTOR CORPORATION

Foreword

- This guide provides precautions for emergency responders when handling TOYOTA/LEXUS vehicles during an incident.
- It is important to read this guide thoroughly and understand the structure and features of TOYOTA/LEXUS vehicles to ensure safety.
- The illustrations used in this guide are representative examples. Refer to the Rescue Sheet for each model for model specific information such as key identification points, component locations, etc.

Table of Contents

Foreword

0. Rescue Sheet	8
1. Identification / recognition	9
Components Requiring Special Attention	
• High Voltage System	10
• Fuel Cell (FC) System	13
• 48V System	16
• High Intensity Discharge (HID) Headlights	17
• Electric Power Steering (EPS)	18
• EC Mirror	19
Emergency Response Key Points	
• Vehicle Identification	21
Appearance and Logos	21
Frame Number	25
Vehicle Identification Number (VIN)	26
2. Immobilisation / stabilisation / lifting	27
Emergency Response Key Points	
• Immobilize Vehicle	28
Vehicle with High Voltage Battery	31
Vehicle with Hydrogen Gas	31
• Stabilize Vehicle	34
3. Disable direct hazards / safety regulations	35
Components Requiring Special Attention	
• High Voltage System	36
High Voltage Power Cable	37
Inverter/Converter	38
DC/DC Converter	39
HEV/BEV/FCEV Transmission	40
HEV/BEV/FCEV Transaxle	40
Rear Drive Motor	41
A/C Compressor	42
Coolant Heater	43
Plug-in Charging System	44
Accessory Socket (AC220V / 1500W, AC220V / 2400W)	47
ESU (Electricity Supply Unit)	48

• Fuel Cell (FC) System	49
FC Water Pump and Hydrogen Pump Inverter	50
FC Boost Converter	50
FC Air Compressor	51
FC Water Pump	52
• Solar Charging System	53
1st generation solar charging system	53
2nd generation solar charging system	56
• Solar Powered Ventilation System	59
• Cable cut	60
• Low voltage device that disconnects high voltage	61
• Interlock Connector	62

Emergency Response Key Points

• Disable Vehicle	64
Vehicle with High Voltage Battery	73
Vehicle with Plug-in Charge System	74
Vehicle with Hydrogen Gas	76

4. Access to the occupants

77

Components Requiring Special Attention

• Doors	78
Flush Handle Type	78
e-latch Handle	80
Door Open Switch	83
Access Door (Double door)	84
Back Door	85
• Structural Reinforcements	86
Side Impact Protection Beam	86
Ultra High Tensile Strength Sheet	87
• Carbon Fiber Reinforced Plastic (CFRP)	88
• Window Glass	89
Laminated Glass	90
Tempered Glass	90
• Front Seat	91
Manual Seat	92
Power Seat	93
• Rear Seat	96
Manual Seat	96
Power Seat	98

• Headrest	99
Manual Headrest	100
Power Headrest	101
• Active Headrest System	102
• Tilt & Telescopic Steering	103
Manual Tilt & Telescopic	103
Power Tilt & Telescopic	104

Emergency Response Key Points

• Access Occupants	106
Vehicle with High Voltage Battery	107
Vehicle with Hydrogen Gas	107
Cut Vehicle	108

5. Stored energy / liquids / gases / solids 110

Components Requiring Special Attention

• Battery low voltage	111
12 V Battery	111
Sub-battery	113
• Ultra-capacitor, low-voltage	115
• High Voltage System	116
High Voltage Battery	116
• Fuel Cell (FC) System	119
FC Stack	119
Hydrogen Tank	120
Hydrogen Pipes	121
Hydrogen Pump	122
• CNG Tank	123
• LPG Tank	124
• Air Tank	126
• Urea Selective Catalytic Reduction (SCR) System	127

Emergency Response Key Points

• Spills	129
Coolant	129

Table of Contents

Lubrication Oil	129
Brake Fluid	129
Power Steering Fluid	129
Window Washer Fluid	129
12 V Battery Electrolyte	130
Sub-battery Electrolyte	130
48V Battery Electrolyte	131
Vehicle with High Voltage Battery	132
Traction Battery Coolant	133
Vehicle with Solar Battery	133
Vehicle with Urea Solution	134
Vehicle with Hydrogen Gas	134

• Gas Leaks 135

Nitrogen (N ₂) Gas	135
Refrigerant Gas	135
Vehicle with CNG	135
Vehicle with LPG	136
Vehicle with Hydrogen Gas	136

6. In case of fire 137

Emergency Response Key Points

• Fire 138

Fire Extinguisher	138
Vehicle with High Voltage Battery	138
Vehicle with Lithium ion (Li-ion) Battery	139
Vehicle with Urea Solution	140
Vehicle with Hydrogen Gas	140

7. In case of submersion 142

Emergency Response Key Points

• Submersion 143

Vehicle with High Voltage Battery	143
-----------------------------------	-----

8. Towing / transportation / storage 144

Damaged Vehicle Handling Key Points

• Towing Damaged Vehicle 145

Table of Contents

Parking Lock	146
Steering Wheel Lock	146
Steer-by-Wire System	147
Precautions for FF (Front-engine Front-wheel drive) vehicle	148
Precautions for FR (Front-engine Rear-wheel drive), MR (Mid-engine Rear-wheel drive) and 4WD (Four Wheel Drive) vehicles	148
Vehicle with High Voltage Battery	149
• Storing a Damaged Vehicle	150
Submerged Vehicle	150
Vehicle with High Voltage Battery	150
Vehicle with Hydrogen Gas	153
Vehicle with Sub-battery	153
9. Important additional information	154
Components Requiring Special Attention	
• SRS Airbags	155
Driver Airbag	158
Passenger Airbag	159
Front Knee Airbag	160
Front Seat Side Airbag	161
Front Seat Center Airbag	162
Front Seat Cushion Airbag	163
Curtain Shield Airbag	164
Rear Seat Side Airbag	165
Rear Seat Cushion Airbag	166
Back Window Curtain Shield Airbag	166
• Automatic rollover protection system	167
• Seat belt pretensioner	168
• Pedestrian protection active system	170
• Gas strut / Preloaded spring	172
Front and Rear Suspension Dampers	172
Engine Hood Damper	173
Luggage Compartment, Hatchback Door, Back Door Dampers	173
Performance Damper	174
Tail Gate Damper, Side Gate Damper	175
Seat Damper	176
10. Explanation of pictograms used	177

0. Rescue Sheet

- With regards to the detailed information for each vehicle, refer to the rescue sheet for the respective vehicle on Toyota Motor's public website.

Components Requiring Special Attention

- The construction and functions of components requiring special attention during emergency response are described in this section.
- With regards to the pictograms used, refer to chapter 10. Explanation of pictograms used (P177)

High Voltage System

- Hybrid vehicles (HEV), plug-in hybrid vehicles (PHEV), electric vehicles (BEV) and fuel cell vehicles (FCEV) use a motor driven by high voltage electricity (120V - 800V) to generate the driving torque. These vehicles are equipped with high voltage electrical components such as a high voltage battery, inverter/converter, transmission/transaxle (electric motor), A/C compressor, charger and voltage inverter as well as high voltage power cables.
- Refer to the Fuel Cell (FC) system (see page 49) for information on the high voltage parts specific to fuel cell vehicles (FCEV).
- High voltage electrical components can be indicated by markings on their case/cover. High voltage power cables are indicated by an orange color.
- The cases/covers of the high voltage electrical components are insulated from the high voltage conductors inside the components. The vehicle body is insulated from the high voltage electrical components, and is safe to touch during normal conditions.
- The READY indicator in the combination meter turns on while the high voltage system is operating.

- The high voltage system is deactivated when the ignition switch or power switch is turned OFF. If an impact is detected (SRS airbag is activated) or if a high voltage leakage is detected, the high voltage system is automatically deactivated. When the high voltage is shut off, the READY indicator turns off. However, if the remote air conditioning system or plug-in charging system are being used, even if the READY indicator turns off, the high voltage system may still be active.
- For fuel cell vehicles (FCEV), even if the READY indicator turns off, the high voltage system may still be active if the H₂O indicator in the combination meter is illuminated.

*1 H₂O Indicator

- There are 2 types of batteries for the high voltage battery. A nickel metal hydride (Ni-MH) battery and a Lithium-ion (Li-ion) battery.

- Nickel metal hydride (Ni-MH) battery (120 to 400 V)
- Lithium-ion (Li-ion) battery (120 to 800 V)

- Refer to the Rescue Sheet for each model for the locations of the high voltage electrical components.

- The high voltage system may remain charged for up to 10 minutes after the vehicle is shut off and disabled (see page 64). Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from severe burns and electric shock from the high voltage electrical system.
- To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component. Wear appropriate protective equipment such as insulated gloves when there is a risk of touching high voltage power cables or high voltage components.
- When the person(s) in charge of handling the damaged vehicle is away from the vehicle, other person(s) may accidentally touch the vehicle and be electrocuted, resulting in severe injury or death. To avoid this danger, display a "HIGH VOLTAGE DO NOT TOUCH" sign to warn others (print and use page 12 of this guide).

Person in charge:

CAUTION:
HIGH-VOLTAGE
DO NOT TOUCH.

CAUTION:
HIGH-VOLTAGE
DO NOT TOUCH.

Person in charge:

When performing work on the HV system, fold this sign and put it on the roof of the vehicle.

Fuel Cell (FC) System

- Fuel cell vehicles (FCEV) use a motor for driving force in the same way as hybrid vehicles. In order to drive the motor, a high voltage (over 200 V, up to 650 V) is used. Not having an engine, the vehicle uses a motor driven by the power generated by a chemical reaction between the hydrogen fuel and oxygen in the air.
- Fuel cell vehicles (FCEV) are equipped with dedicated high voltage components such as an FC stack, hydrogen pump, FC water pump, FC water pump and hydrogen pump inverter, FC boost converter and FC air compressor.
- To use hydrogen for power generation, fuel cell vehicles (FCEV) are equipped with hydrogen pipes and hydrogen-related parts such as an FC stack, hydrogen tanks, etc.
- The hydrogen tanks are filled with high pressure hydrogen gas (a maximum of 70 MPa (714 kgf/cm², 10,153 psi) at 15°C (59°F)).
- The hydrogen-related parts are inside cases/covers. Also, some of the insulation on highpressure hydrogen pipes is in red.
- Hydrogen gas is colorless, odorless, and harmless.
- Hydrogen gas is flammable, and can ignite in a wide range of concentrations (4 to 74.5%). However, it diffuses easily and tends not to accumulate, so a small amount of leak would quickly dissipate to a concentration that cannot ignite.
- In case of hydrogen leakage, the hydrogen detector equipped on the vehicle detects the hydrogen leak and shuts off the supply of hydrogen by means of solenoid valves on the tank to prevent a mass leak. Also, hydrogen-related parts are located outside the cabin to allow leaked hydrogen to be easily diffused.
- If a collision is detected, the supply of hydrogen is shut off to prevent a mass leak due to vehicle damage.
- For details about the installation locations of hydrogen-related parts, refer to the Rescue Sheet for the vehicle.

WARNING

- If the sound of hydrogen leaking (a loud hissing sound) can be heard when working on the vehicle, or if the hydrogen concentration around the vehicle exceeds 1% when measured with a hydrogen concentration detector, immediately step away from the vehicle as there is a chance that the hydrogen gas may ignite.
- Even after the vehicle is stopped (see page 64), hydrogen remains inside the FC stack, hydrogen tanks and other hydrogen-related parts, as well as inside the hydrogen pipe. In order to avoid fires and explosions, never cut or damage these hydrogen-related parts or the hydrogen pipe.
- When the person(s) in charge of handling the damaged vehicle are away from the vehicle and someone else accidentally approaches or touches the vehicle, death or serious injury may occur due to electrocution, a rupture, an explosion or fire. To avoid this danger, display “HIGH VOLTAGE DO NOT TOUCH” and “HIGH PRESSURE GAS DO NOT TOUCH” signs to warn others (print and use page 12 and 15 of this guide).

Person in charge: _____

CAUTION:
HIGH-PRESSURE GAS
DO NOT TOUCH.

CAUTION:
HIGH-PRESSURE GAS
DO NOT TOUCH.

Person in charge: _____

48V System

- The 48V system is composed of the 48V control starter generator motor, 48V control with converter ECU and 48V battery.
- The 48V system is voltage from the 48V control starter generator motor assembly and 48V battery assembly is dropped in order to supply power to electrical components and the auxiliary battery.
- The 48V control starter generator motor performs engine motive force assist, generates power while driving, and performs regeneration when the accelerator pedal is released.
- The 48V control with converter ECU starts and stops the engine, and controls engine assist and regeneration, based on signals from sensors, switches, and ECUs.

*1	12V Battery	*2	48V Battery
*3	48V Control With Converter ECU	*4	48V Control Starter Generator Motor

High Intensity Discharge (HID) Headlights

- Headlights use High Intensity Discharge (HID) bulbs, which emit light by creating an electric discharge between electrodes inside the bulbs.
- When the HID headlights are turned on, high voltage of approximately 20,000 to 30,000 V is generated instantaneously. During illumination, the voltage from the 12 V battery is boosted to a maximum of 45 V in the electric circuit of the discharge headlights to drive the discharge headlights.

*1	Discharge Headlights
----	----------------------

WARNING

- To prevent serious injury or death from electric shock, avoid touching, cutting, or breaching the bulb, socket, electric circuit and components of the headlights.
- To prevent burns, avoid touching the metal parts on the back of the headlights and the high voltage sockets while the discharge headlights are turned on or immediately after they are turned off.

Electric Power Steering (EPS)

- The Electric Power Steering (EPS) system uses 12 V voltage which has been boosted to up to 46 V by the EPS ECU to drive an EPS assist motor.
- The EPS assist motor is built into the steering gear box or steering column.
- Some hybrid models use voltage from the high voltage battery to drive the EPS assist motor by lowering it to up to 46 V using an EPS the DC/DC converter.
- A wire which conducts up to 46 V connects the EPS ECU in the engine compartment or the instrument panel to the EPS assist motor.

*1	EPS ECU	*2	EPS Assist Motor
----	---------	----	------------------

- The Dynamic Rear Steering (DRS) system equipped on some vehicle models uses 12 V voltage which has been boosted to up to 34 V by the DRS ECU to drive the DRS assist motor.

*1	DRS Assist Motor	*2	DRS ECU
----	------------------	----	---------

EC Mirror

- The inner rear view mirror has an auto glare-resistance function, which automatically changes the reflection rate of the mirror. This is done by controlling voltage applied to an electrochromic gel inside the mirror, according to the brightness sensed by a light sensor.

*1	Inner Rear View Mirror	*2	Electrochromic Gel
----	------------------------	----	--------------------

- The electrochromic gel contains organic solvents.

- Organic solvents may cause irritation of the skin if contacted. Wear appropriate protective equipment such as rubber gloves and safety goggles when there is a risk of touching electrochromic gel.

Emergency Response Key Points

- Procedures and points to be noted when handling TOYOTA/LEXUS vehicles during emergency response are provided in this section.
- Refer to the Rescue Sheet for each model for model specific information such as vehicle identification points, component locations, etc.

Vehicle Identification

Appearance and Logos

- Identify the vehicle type based on exterior features and logos on the body.
- Logo marks represent the make, model, grade, and the vehicle type (HEV/BEV/FCEV) if it uses a high voltage electrical system.
- Logo marks are attached to the trunk lid, back door/hatch, rocker panels, front grille and fender.

Vehicle Identification

*1	Brand Logo	*2	Model/Grade	*3	Hybrid
*4	Plug-in-Hybrid				

Vehicle Identification

*1	Brand Logo	*2	Model/Grade	*3	Fuel Cell
----	------------	----	-------------	----	-----------

Vehicle Identification

*1	Brand Logo	*2	Model/Grade	*3	BEV
----	------------	----	-------------	----	-----

Frame Number

- A frame number is stamped on the name plate attached to the engine compartment and front passenger door pillar.
- Characters before a hyphen (e.g.: ○○○○ for the frame number ○○○○-△△△△) represent the vehicle model.
- When a cover is installed under the driver seat, a frame number is stamped on the frame underneath the cover.

*1	Frame No.	*2	Name Plate
----	-----------	----	------------

Vehicle Identification Number (VIN)

- The VIN is stamped on the name plate attached to the windshield cowl and driver door pillar.
- The vehicle model can be identified by the VIN.

*1	VIN
----	-----

Emergency Response Key Points

- Procedures and points to be noted when handling TOYOTA/LEXUS vehicles during emergency response are provided in this section.
- Refer to the Rescue Sheet for each model for model specific information such as vehicle identification points, component locations, etc.

Immobilize Vehicle

- On arrival, completely immobilize the vehicle by following procedures 1, 2 and 3 to ensure safe emergency response operations.

1. Chock wheels and set the parking brake.

- The following types of parking brakes are available. Operate the parking brake accordingly.

*1

*2

*3

*4

*1	Lever Type	*2	Foot Pedal Type
*3	Switch Type (Pull-type Switch)	*4	Switch Type (Push-type Switch)

- For vehicles with a switch type, operate the switch twice in order to make sure that the vehicle is securely fixed in place.

2. For automatic vehicles, move the shift lever to the park (P) position. For manual vehicles, shut off the vehicle (see page 64), then move the shift lever to the 1st or reverse (R).

■ Park (P) can be selected by the following methods. Operate the vehicle accordingly.

*1

*2

*1	Shift Lever Type	*2	P Position Switch Type
----	------------------	----	------------------------

3. To facilitate emergency response operations, lower the windows, open the back door, unlock the doors and take other necessary actions before shutting off the vehicle.

■ The following systems are powered by the 12 V battery. Operate them as required before disconnecting the battery.

- Power door lock
- Power window
- Power tilt and telescopic steering
- Power seat

Immobilize Vehicle

*1

*2

*3

*4

*1	Door Unlock	*2	Power Window Adjustment
*3	Steering Wheel Adjustment	*4	Seat Adjustment

NOTICE

■ Once the 12 V battery is disconnected (see page 64), power controls will not operate.

Vehicle with High Voltage Battery

- Hybrid vehicles (HEV), plug-in hybrid vehicles (PHEV), electric vehicles (BEV) and fuel cell vehicles (FCEV) are equipped with a high voltage electrical system (120 to 800 V).

WARNING

- To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component. Wear appropriate protective equipment such as insulated gloves when there is a risk of touching high voltage power cables or high voltage components.

Vehicle with Hydrogen Gas

- Fuel cell vehicles (FCEV) carry compressed hydrogen gas. Before performing the normal procedures to immobilize the vehicle, follow the steps below first.

WARNING

- Hydrogen gas is colorless, odorless and flammable.
- Compared to gasoline or natural gas, hydrogen gas can ignite in a wide range of concentrations (4 to 74.5%). If the sound of hydrogen leaking (a loud hissing sound) can be heard when working on the vehicle, or if the hydrogen concentration around the vehicle exceeds 1% when measured with a hydrogen concentration detector, immediately step away from the vehicle as there is a chance that the hydrogen gas may ignite.

NOTICE

- Depending on the model, multiple hydrogen tanks may be installed. For the detailed installation locations of hydrogen tanks for each model, refer to the Rescue Sheet for each model.

- Confirm that there is no sound of hydrogen leakage (a loud hissing sound).

- When approaching the vehicle, approach from the front.
- If the sound of leakage can be heard, immediately step away from the vehicle, as the hydrogen may ignite.
- Confirm that the sound of leakage is no longer present before proceeding to the next procedure.

2. Using a hydrogen concentration detector, measure the hydrogen concentration around the vehicle, and confirm that it does not exceed 1%.

* For more information about the hydrogen concentration detector, please contact your dealer.

■ If the concentration exceeds 1%, immediately step away from the vehicle, as the hydrogen may ignite.

■ If a ventilator is available, fanning the area can reduce the hydrogen concentration. Blow the fan from the front toward the rear of the vehicle. When approaching the vehicle, approach from the direction where the wind is coming from.

■ Measure the hydrogen concentration at regular intervals and confirm that the hydrogen concentration does not exceed 1% before proceeding to the next step.

3. Immobilize the vehicle according to the normal procedures.

4. Flow chart of actions required before performing emergency response procedures

- Make sure to wear insulated gloves and anti-static shoes and check that the hydrogen concentration is below the flammability limit (4%).

Stabilize Vehicle

- Crib at four points directly under the front and rear pillars using wooden blocks or equivalent objects.

WARNING

- Do not place cribbing such as wooden blocks or rescue air lifting bags under the exhaust system, fuel system or high voltage power cables. Failure to do so may cause heat generation, bursting of the air lifting bags, damage to the high voltage power cables or damage to the hydrogen piping, resulting in a vehicle fire, crushing accident, electrical shock or gas leak, possibly leading to serious injury or death.

Components Requiring Special Attention

- The construction and functions of components requiring special attention during emergency response are described in this section.

High Voltage System

WARNING

- The high voltage system may remain charged for up to 10 minutes after the vehicle is shut off and disabled (see page 12). Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from severe burns and electric shock from the high voltage electrical system.
- When the person(s) in charge of handling the damaged vehicle is away from the vehicle, other person(s) may accidentally touch the vehicle and be electrocuted, resulting in death or serious injury. To avoid this danger, display a “HIGH VOLTAGE DO NOT TOUCH” sign to warn others (print and use page 12 of this guide).
- The high voltage battery may be charged even when the vehicle is stopped. To stop the high voltage battery from charging, remove the negative (-) terminal of the 12 V battery.
- To prevent electric shock, after disconnecting the high voltage connector, wait for at least 10 minutes before touching any of the high-voltage connectors or terminals.

High Voltage Power Cable

- High voltage power cables are indicated by an orange color and are used to connect high voltage electrical components such as the high voltage battery inverter/converter, electric motor, A/C compressor and charger.
- The high voltage power cables are installed in the engine/motor compartment and in the center of the vehicle (routed through the center tunnel) or on either side away from the rocker panels.
- Also, high voltage cables are used in the plug-in charging system (see page 44) and the solar charging system (see page 53).

*1 High Voltage Power Cable

Inverter/Converter

- The inverter/converter installed in the engine/motor compartment boosts and inverts the DC electricity from the high voltage battery to AC electricity that drives the electric motor.
- The inverter/converter of fuel cell vehicles (FCEV) also supplies an electric current converted to AC to the FC air compressor.

*1	Inverter/Converter
----	--------------------

DC/DC Converter

- The DC/DC converter lowers the DC electricity from the high voltage battery to supply it to electric accessories such as the headlights and power windows, and to charge the 12 V battery.
- The DC/DC converter is built into the inverter/converter or installed in the area near the high voltage battery on some models.

*1	DC/DC Converter (Built into Inverter/Converter)	*2	DC/DC Converter
----	---	----	-----------------

HEV/BEV/FCEV Transmission

HEV/BEV/FCEV Transaxle

- The HEV/BEV/FCEV transmission/transaxle contains an electric motor/generator that is powered by output voltage (up to 650 V) from the inverter/converter, and charges the high voltage battery.
- The HEV/BEV/FCEV transmission/transaxle is installed in the engine compartment or motor compartment. Location varies depending on layout.

*1	HEV/BEV/FCEV Transmission	*2	HEV/BEV/FCEV Transaxle
----	---------------------------	----	------------------------

Rear Drive Motor

- The rear drive motor is powered by output voltage (up to 650 V) from the inverter/converter.
- It is built into the rear transaxle and located above the rear driveshafts.

*1	Rear Transaxle (Rear Drive Motor)
----	-----------------------------------

A/C Compressor

- The A/C compressor used on hybrid vehicles (HEV), electric vehicles (BEV) and fuel cell vehicles (FCEV) contains an electric motor that is powered by electricity from the high voltage battery. It is installed in the engine/motor compartment.

*1

A/C Compressor

Coolant Heater

- Fuel cell vehicles (FCEV) is equipped with a coolant heater to heat the coolant, installed inside the motor compartment.
- The coolant heater is operated using the power from the high voltage battery.

*1

Coolant Heater

Plug-in Charging System

- Plug-in hybrid vehicles (PHEV) and electric vehicles (BEV) are equipped with a plug-in charging system in order to charge the high voltage battery from an external power source.
- The plug-in charging system is mainly comprised of an onboard charger and charging inlet.
- The onboard charger converts the AC supplied from an external power source to DC, boosts it, and then uses it to charge the high voltage battery.
- The charger inlet receives the charge to the high voltage battery from an external power source. Also, some electric vehicles have a separate fast charging inlet which can be used at fast chargers (DC 500 V).
- The orange power cables are connected to the charging inlet, which is supplied high voltage during charging.

*1	Onboard Charger	*2	High Voltage Power Cable
*3	Charging Inlet	*4	Fast Charging Inlet

WARNING

- To prevent serious injury or death from severe burns or electric shock, shut off the utility circuit supplying power to the charge cable before disconnecting it if the vehicle, charge cable or charger is submerged in water.

NOTICE

- Some plug-in hybrid vehicles and electric vehicles have a connector locking system. The charging connector is unlocked by pressing the charging connector lock switch after unlocking the doors.

- If the lock of the charge cable assembly connector cannot be released, turn OFF or unplug the external charger, or turn its main breaker OFF.

- The lock of the charge cable assembly connector cannot be released during fast charging. If charging does not stop even when the charger is turned OFF, turn its main breaker OFF.

Accessory Socket (AC220V / 1500W, AC220V / 2400W)

- Hybrid electric vehicles (HEV), plug-in hybrid electric vehicles (PHEV), fuel cell electric vehicles (FCEV) and battery electric vehicles (BEV) are equipped with an accessory socket that supplies power to electric devices compatible with output voltage/output power: AC100V/1500W.
- It converts the voltage from the high voltage battery with a dedicated voltage inverter, separate from the high voltage inverter or converter, and supplies power to the accessory socket.
- The voltage inverter is connected with an orange high voltage cable, and high voltage current flows through it when the high voltage system is running.

*1	Accessory Socket	*2	High Voltage Power Cable
*3	Voltage Inverter	-	-

ESU (Electricity Supply Unit)

- An ESU (Electricity Supply Unit) is used which packages the power converter necessary for electric vehicles, and the components traditionally built into the high voltage battery (high voltage junction box, DC relay) into one unit.
- A 2 layer construction is used with the upper layer containing the high voltage junction box, charging inverter ECU and DC relay, and the lower layer containing the DC/DC converter and AC charger.

*1	ESU (Electricity Supply Unit)	*2	Charging Inverter ECU
*3	DC Relay	*4	DC/DC Converter
*5	AC Charger		

Fuel Cell (FC) System

WARNING

- If the sound of hydrogen leaking (a loud hissing sound) can be heard when working on the vehicle, or if the hydrogen concentration around the vehicle exceeds 1% when measured with a hydrogen concentration detector, immediately step away from the vehicle as there is a chance that the hydrogen gas may ignite.
- Even after the vehicle is stopped (see page 64), hydrogen remains inside the FC stack, hydrogen tanks and other hydrogen-related parts, as well as inside the hydrogen pipe. In order to avoid fires and explosions, never cut or damage these hydrogen-related parts or the hydrogen pipe.
- When the person(s) in charge of handling the damaged vehicle are away from the vehicle and someone else accidentally approaches or touches the vehicle, death or serious injury may occur due to electrocution, a rupture, an explosion or fire. To avoid this danger, display “HIGH VOLTAGE DO NOT TOUCH” and “HIGH PRESSURE GAS DO NOT TOUCH” signs to warn others (print and use page 12 and 15 of this guide).

FC Water Pump and Hydrogen Pump Inverter

- The FC water pump and hydrogen pump inverter converts DC from the high voltage battery to AC, and supplies this current to the hydrogen pump and FC water pump.
- The FC water pump and hydrogen pump inverter is installed in the motor compartment.

*1 FC Water Pump and Hydrogen Pump Inverter

FC Boost Converter

- The FC boost converter increases the voltage of DC generated by the FC stack to a maximum of 650 V for motor operation, and then supplies this current to the inverter/converter.
- The FC boost converter is installed in the center tunnel (outside the cabin).

*1 FC Boost Converter

FC Air Compressor

- The FC air compressor supplies air (oxygen) to the FC stack.
- The FC air compressor has a built-in motor which is driven using the output voltage from the inverter/converter (up to 650 V), and is installed in the motor compartment.

*1	FC Air Compressor
----	-------------------

FC Water Pump

- The FC water pump circulates the coolant to cool the FC stack.
- The FC water pump has a built-in motor which is driven using the high voltage from the FC water pump and hydrogen pump inverter, and is installed in the motor compartment.

*1	FC Water Pump
----	---------------

Solar Charging System

1st generation solar charging system

- The solar charging system uses a solar roof with an integrated solar cell to generate photovoltaic power which is then used to charge the high voltage battery according to the vehicle condition while parked and to compensate for the consumption of the 12 V battery system while the vehicle is being driven. In addition, the solar charging system charges and discharges the solar battery during this process.
- The solar charging system consists of a solar roof, a solar battery, a solar energy control unit, a high voltage battery and a 12 V battery.
- The orange high voltage power cable is connected between the solar energy control unit and high voltage battery. High voltage is applied when the high voltage battery is charging.
- The solar energy control unit has 3 built-in DC-DC converters: for the high voltage battery, solar battery and auxiliary system.
- An Ni-MH battery is used for the solar battery.
 1. The Ni-MH battery consists of 3 modules, each consisting of six 1.2 V cells, connected in series to obtain 21.6 V.
 2. The Ni-MH battery contains a strong alkaline electrolyte (pH 13.5). The electrolyte, however, is absorbed in the cell plates and will not normally spill or leak out even if a battery module is cracked.
 3. Electrolyte leakage from the solar battery is unlikely due to its construction and the amount of available electrolyte contained within the Ni-MH modules. Any spillage would not warrant a declaration as a hazardous material incident.
- The high voltage battery is not charged except for when the power switch is off.
- Depending on conditions such as solar radiation and temperature, the solar roof can reach a maximum voltage of approximately 50 V.
- Refer to the Rescue Sheet for each model for the locations of the high voltage electrical components.

*1	Solar Roof	*2	12 V Battery	*3	Solar Battery
*4	Solar Energy Control Unit	*5	High Voltage Power Cable	*6	High Voltage Battery

WARNING

- The high voltage system may maintain the voltage even when the vehicle is stopped (see page 64) due to the solar charging system. If the high voltage system is not stopped, the high voltage may lead to severe burns or electric shock and may result in death or serious injury.
- To prevent death or serious injury from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component. Wear appropriate protective equipment such as insulated gloves when there is a risk of touching high voltage power cables or high voltage components.
- When the person(s) in charge of handling the damaged vehicle is away from the vehicle, other person(s) may accidentally touch the vehicle and be electrocuted, resulting in death or serious injury. To avoid this danger, display a “HIGH VOLTAGE DO NOT TOUCH” sign to warn others (print and use page 12 of this guide).
- The high voltage battery may be charged even when the vehicle is stopped. To stop the high voltage battery from charging, remove the negative (-) terminal of the 12 V battery.
- The solar roof generates electricity with even a small amount of sunlight. To stop generation of electricity, cover the solar roof completely with a material that will block sunlight.
- Strong alkaline electrolyte (pH 13.5) is harmful to the human body. To avoid injury by coming in contact with the electrolyte, wear appropriate protective equipment such as rubber gloves and safety goggles when there is a risk of touching electrolyte.

2nd generation solar charging system

- The solar charging system uses a solar roof with an integrated solar cell to generate photovoltaic power which is then used to charge the high voltage battery according to the vehicle condition while parked and to compensate for the consumption of the 12 V battery system while the vehicle is being driven. In addition, the solar charging system charges and discharges the solar battery during this process.
- The solar charging system consists of a solar roof, a solar battery, a solar energy control unit, a high voltage battery and a 12 V battery.
- The orange high voltage power cable is connected between the solar energy control unit and high voltage battery. High voltage is applied when the high voltage battery is charging.
- The solar energy control unit has 3 built-in DC-DC converters: for the high voltage battery, solar battery and auxiliary system.
- A 15 A fuse is used to prevent a dangerous situation even if there is a large flow of current.
- The high voltage battery is not charged except for when the power switch is off.
- Depending on conditions such as solar radiation and temperature, the solar roof can reach a maximum voltage of approximately 50 V.
- Refer to the Rescue Sheet for each model for the locations of the high voltage electrical components.

*1	Solar Roof	*2	12 V Battery	*3	High Voltage Junction Box
*4	High Voltage Battery	*5	Solar Energy Control Unit		

WARNING

- The high voltage system may maintain the voltage even when the vehicle is stopped (see page 64) due to the solar charging system. If the high voltage system is not stopped, the high voltage may lead to severe burns or electric shock and may result in death or serious injury.
- To prevent death or serious injury from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component. Wear appropriate protective equipment such as insulated gloves when there is a risk of touching high voltage power cables or high voltage components.
- When the person(s) in charge of handling the damaged vehicle is away from the vehicle, other person(s) may accidentally touch the vehicle and be electrocuted, resulting in death or serious injury. To avoid this danger, display a “HIGH VOLTAGE DO NOT TOUCH” sign to warn others (print and use page 12 of this guide).
- The high voltage battery may be charged even when the vehicle is stopped. To stop the high voltage battery from charging, remove the negative (-) terminal of the 12 V battery.
- The solar roof generates electricity with even a small amount of sunlight. To stop generation of electricity, cover the solar roof completely with a material that will block sunlight.

Solar Powered Ventilation System

- The solar powered ventilation system uses solar panels on the vehicle roof to generate up to 27 V of electricity. This electricity is used to power an electric fan which ventilates the cabin while the vehicle is parked in the hot sun.

*1 Solar Panels

WARNING

- The solar panels generate electricity with even a small amount of sunlight. To stop generation of electricity, cover the solar panels completely with a material that will block sunlight.

Cable cut

- The vehicle is equipped with a cable cut which enables the high-voltage isolation procedure to be performed quickly and safely.
- A sticker is attached to the cable cut for easy identification.
- For the detailed installation location, refer to the Rescue Sheet for the respective vehicle.

Low voltage device that disconnects high voltage

- The vehicle is equipped with a service plug which enables the high-voltage isolation procedure to be performed safely during inspection and maintenance.

Interlock Connector

- Some vehicles are equipped with an interlock plug to safely perform high voltage shutdown operation during service maintenance.

*1	Interlock Connector
----	---------------------

Emergency Response Key Points

- Procedures and points to be noted when handling TOYOTA/LEXUS vehicles during emergency response are provided in this section.
- Refer to the Rescue Sheet for each model for model specific information such as vehicle identification points, component locations, etc.

Disable Vehicle

- To ensure safe emergency response operations, the vehicle must be completely turned off by shutting off the power from the fuel pump, SRS airbag, high voltage battery, plug-in charging system, etc.
- Confirm the vehicle status. **If any of the following conditions exist**, the vehicle may not shut off.

- Engine is running.
- Ignition switch is in ACC, ON or START position.
- Meters are illuminated.
- Air conditioning is operating.
- Audio system is operating.
- Wipers are operating.
- Navigation or other displays are turned on.
- Charge cable is connected.

WARNING

- NEVER assume the vehicle is shut off simply because it is silent. If the vehicle is equipped with an idling stop system, or the vehicle is a hybrid vehicle (HEV) or plug-in hybrid vehicle (PHEV), the engine is silent while the vehicle is on. Make sure none of the above conditions exist.
- Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from unintentional deployment of the SRS airbags or unintentional actuation of the seat belt pretensioners, pedestrian protection active system, or active headrests.

- When the vehicle is operating, carefully perform one of the procedures from 1 to 4 to disable the vehicle.

Procedure 1

1. Turn the ignition switch to the LOCK (OFF) position or push the engine/power switch once to shut off the vehicle.

- If the vehicle is equipped with an engine/power switch the vehicle is shut off when **ALL of the following conditions are met**. With all of the following conditions met, do not push the engine/power switch as the vehicle will start.

- Engine is not running.
- Meters are not illuminated.
- Air conditioning is not operating.
- Audio system is not operating.
- Wipers are not operating.
- Navigation and other displays are turned off.
- Charge cable is disconnected.

NOTICE

- The engine/power switch operates as follows.

With the brake pedal (for automatic vehicles) or the clutch pedal (for manual vehicles) depressed:

Vehicle Start → Stop → Start ... is repeated every time the switch is pushed.

With the brake pedal (for automatic vehicles) or the clutch pedal (for manual vehicles) released:

Accessory → Ignition-On → Off → Accessory... is repeated.

- When in "Accessory" mode, the radio and other accessory components are operational.
- When in "Ignition-On" mode, the power windows, wipers, heater/air conditioner fan and other components including SRS system are operational.
- The vehicle will not start if the brake pedal (for automatic vehicles) or the clutch pedal (for manual vehicles) is not depressed, even if the switch is pushed.

*A

*B

*A	Brake Pedal Depressed	*B	Brake Pedal Released	*C	Ignition Mode Sequence
*1	Switch Push				

2. When the vehicle is equipped with an engine/power switch, keep the electrical key transmitter 5 meters (16.4 feet) or more away from the vehicle.

NOTICE

- If the electrical key transmitter is in the cabin or near the vehicle, the vehicle may start depending on what operations are performed. For example, if the engine/power switch is pushed.
- To prevent unexpected starting of the vehicle, place the electrical key transmitter outside of the detection area.

3. Disconnect the negative (-) terminal of the 12 V battery.

- The 12 V battery is installed in the engine compartment, in the luggage compartment or under the rear seat.
- Refer to the Rescue Sheet for each model for the location of the 12 V battery.

NOTICE

- Shut off the power to the electrical system to prevent electrical fires and to keep the vehicle from starting.
- After the negative (-) terminal of the 12 V battery has been disconnected and the power has been shut off, approximately 12 V is maintained between the positive (+) terminal and negative (-) terminal of the sub-battery for up to approximately 10 minutes.

Procedure 2 Remove the appropriate fuse (Alternate if the ignition switch or power switch is inoperative)

1. Open the hood. Remove the engine room covers, if any are present.

2. Remove the engine compartment fuse box cover.

3. Remove the appropriate fuse.

- Refer to the Rescue Sheet for each model for the fuse to be removed.

NOTICE

■ If the correct fuse cannot be identified, pull **ALL fuses in the fuse box until all of the following** conditions are met.

- Engine is not running.
- Meters are turned off.
- Air conditioning is turned off.
- Audio system is turned off.
- Wipers are turned off.
- Navigation and other displays are turned off.

4. Disconnect the negative (-) terminal of the 12 V battery.

- The 12 V battery is installed in the engine compartment, in the luggage compartment or under the rear seat.
- Refer to the Rescue Sheet for each model for the location of the 12 V battery.

NOTICE

- Shut off the power to the electrical system to prevent electrical fires and to keep the vehicle from starting.
- After the negative (-) terminal of the 12 V battery has been disconnected and the power has been shut off, approximately 12 V is maintained between the positive (+) terminal and negative (-) terminal of the sub-battery for up to approximately 10 minutes.

Procedure 3 Remove the appropriate fuse (Alternate if the ignition switch or power switch is inoperative)

1. Open the hood. Remove the engine room covers, if any are present.

2. Remove the engine compartment fuse box cover.

3. Remove the appropriate fuse.

- Refer to the Rescue Sheet for each model for the fuse to be removed.

NOTICE

■ If the correct fuse cannot be identified, pull **ALL fuses in the fuse box until all of the following** conditions are met.

- Engine is not running.
- Meters are turned off.
- Air conditioning is turned off.
- Audio system is turned off.
- Wipers are turned off.
- Navigation and other displays are turned off.

4. Disconnect the negative (-) terminal of the 12 V battery.

- The 12 V battery is installed in the engine compartment, in the luggage compartment or under the rear seat.
- Refer to the Rescue Sheet for each model for the location of the 12 V battery.

NOTICE

- Shut off the power to the electrical system to prevent electrical fires and to keep the vehicle from starting.
- After the negative (-) terminal of the 12 V battery has been disconnected and the power has been shut off, approximately 12 V is maintained between the positive (+) terminal and negative (-) terminal of the sub-battery for up to approximately 10 minutes.

Procedure 4 Disconnect the cable cut (Alternate if the ignition switch or power switch is inoperative)

1. Open the hood. Remove the engine room covers, if any are present.

2. Disconnect the cable cut.

- For the installation location, refer to the Rescue Sheet for the respective vehicle.

3. Disconnect the negative (-) terminal of the 12 V battery.

- The 12 V battery is installed in the engine compartment, in the luggage compartment or under the rear seat.
- Refer to the Rescue Sheet for each model for the location of the 12 V battery.

NOTICE

- Shut off the power to the electrical system to prevent electrical fires and to keep the vehicle from starting.
- After the negative (-) terminal of the 12 V battery has been disconnected and the power has been shut off, approximately 12 V is maintained between the positive (+) terminal and negative (-) terminal of the sub-battery for up to approximately 10 minutes.

Vehicle with High Voltage Battery

- Hybrid vehicles (HEV), plug-in hybrid vehicles (PHEV), electric vehicles (BEV) and fuel cell vehicles (FCEV) are equipped with a high voltage electrical system (120 to 800 V).

WARNING

- The high voltage system may remain charged for up to 10 minutes after the vehicle is shut off and disabled (see page 64). Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from severe burns and electric shock from the high voltage electrical system.
- To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component. Wear appropriate protective equipment such as insulated gloves when there is a risk of touching high voltage power cables or high voltage components.
- NEVER assume the hybrid vehicle (HEV), plug-in hybrid vehicle (PHEV) or electric vehicle (BEV) is shut off simply because it is silent. Always observe the instrument cluster for the **READY** indicator status to verify whether the high voltage system is on or shut off. The high voltage system is shut off when the **READY** indicator is off.
- When the vehicle is equipped with a remote air conditioning system and the meters are illuminated, high voltage may be applied to the air conditioning system even though the **READY** indicator is off. Shut off and disable vehicle and ensure the meters are turned off.

Vehicle with Plug-in Charge System

- Plug-in hybrid vehicles (PHEV) and electric vehicles (BEV) are equipped with a system to charge the high voltage battery using power from an external power source.
- If a charge cable is connected to the charging inlet of the vehicle, disconnect the charge cable as follows to stop charging.

1. Push the latch release button on the top of the charging connector and pull it away from the charging inlet of the vehicle.

NOTICE

- Some plug-in hybrid vehicles and electric vehicles have a connector locking system. The charging connector is unlocked by pressing the charging connector lock switch after unlocking the doors.
- If the lock of the charge cable assembly connector cannot be released, turn OFF or unplug the external charger, or turn its main breaker OFF.
- The lock of the charge cable assembly connector cannot be released during fast charging. If charging does not stop even when the charger is turned OFF, turn its main breaker OFF.

2. Close the charging inlet cap and charging port lid.

3. Turn off the external charger by unplugging it or turning its main circuit breaker off.

WARNING

- To prevent serious injury or death from severe burns or electric shock, shut off the utility circuit supplying power to the charge cable before disconnecting it if the vehicle, charge cable or external charger is submerged in water.

Vehicle with Hydrogen Gas

- Fuel cell vehicles (FCEV) carry compressed hydrogen gas. In order to abort refueling, follow the steps below.

1. Operate the hydrogen station to abort refueling.

- Hydrogen inside the hose will depressurized and the filling nozzle can now be removed.

2. Remove the filling nozzle of the hydrogen station from the refueling port (receptacle).

3. Put the cap on the refueling port (receptacle).

4. Close the fuel door.

WARNING

- For fuel cell vehicles (FCEV), even if the READY indicator turns off, the high voltage system may still be active if the H₂O indicator in the combination meter is illuminated. Shut off and disable the vehicle and ensure the meters are turned off.

Components Requiring Special Attention

- The construction and functions of components requiring special attention during emergency response are described in this section.

Doors

- The door is opened by operating the handle on the door.
- Some vehicles are equipped with parts such as flush handles which are normally retracted and pulled to open the door, e-latch handles which contain a switch set inside the handle itself to open the door by pressing it, access doors (double doors) which are opened using the inner door handle, and back doors which are opened after lowering the back window glass.
- Refer to the rescue sheet for the door specifications of each vehicle.

Flush Handle Type

- When voltage is not supplied, such as when the terminal of the 12 V battery is disconnected, the flush handle will not be deployed electrically. In this case, the door handle must be opened manually.
 1. The retracted door handle can be pulled out by pushing on the front end.
 2. The door can be opened by pulling more on the pulled out door handle.

*1	Door Handle
----	-------------

NOTICE

- If the door lock is engaged, insert the mechanical key into the flush handle to release the lock.

*1	Mechanical Key	*a	Unlock
----	----------------	----	--------

e-latch Handle

- When opening the door from outside the vehicle, the door is opened by gripping the outside handle while pressing the switch on the inside. When opening the door from inside the vehicle, the door is opened by pressing the switch on the inside handle.

*A A-A Cross Section

*1 Switch

■ Operations using the door opening switch will be disabled if battery voltage is not being supplied or if a collision occurs in which the airbag is deployed. In these types of situations, the manual release handle inside or outside the vehicle should be used to open the door. When opening the door from inside the vehicle, the door opening switch inside the vehicle will function as a manual release handle. The door is opened by pulling this manual release handle twice.

*A

*B

*A	Outside Release Handle	*B	Inside Release Handle
*1	Release Handle	*2	Release Handle (Door Opening Switch)
*a	Pull twice		

NOTICE

■ If the door is locked, use a plastic card or similar object to release the cover on the outside handle (toward the rear of the vehicle), insert the mechanical key into the key cylinder inside, and then turn toward the unlock side to enable the release handle outside the vehicle.

*1	Cover	*2	Card
*3	Mechanical Key	*a	Unlock Side

Door Open Switch

*A	A-A Cross Section		
*1	Switch	*2	Manual Operate Button

- When opening the door from outside the vehicle, the door can be opened by simultaneously pushing the inside switch while holding the outside handle.
- As operation of the internal switch of the outside handle is disabled when there is no voltage being supplied by the battery, or a collision occurs for which the airbags were deployed, etc., open the door using the manual operate button.

Access Door (Double door)

1. Open the front door as much as possible.
2. Pull the door handle on the access door forward.
3. Open the access door.

*1	Front Door	*2	Access Door
*3	Door Handle		

WARNING

- Before opening either access doors, make sure the front seatbelt is unfastened. If the access door is opened with the front seatbelt fastened, the seatbelt may be locked and squeeze the front occupant, resulting in a serious injury.

Back Door

1. Insert a key into the key cylinder in the back door then turn the key clockwise to lower the back window glass.
2. Pull up the lock knob on the back door to release the lock.
3. Pull up the back door handle to open the back door.

*1	Key Cylinder	*2	Back Door
*3	Back Door Handle	*4	Back Window Glass
*5	Lock Knob		

Structural Reinforcements

- A side impact protection beam and ultra high tensile strength sheet steel that are stronger than normal steel sheets are used as structural reinforcements.
- Refer to the Rescue Sheet for each model for locations of the side impact protection beams and ultra high tensile strength sheet steel.

NOTICE

- Because the strength of side impact protection beam and ultra high tensile strength sheet steel is higher than sheet steel and high tensile strength sheet steel, it is difficult to cut through side impact protection beam and ultra high tensile strength sheet steel with conventional cutters. Avoid side impact protection beam and parts made from ultra high tensile strength sheet steel when cutting a vehicle.

Side Impact Protection Beam

- Side impact protection beams are located inside the door.

*1

Side Impact Protection Beam

Ultra High Tensile Strength Sheet

- Ultra high tensile strength sheet steel, which is approximately 1.5 times higher strength (1.5 GPa (15,296 kgf/cm², 217,557 psi) class) than standard high tensile strength sheet steel (under 1 GPa (10,197 kgf/cm², 145,038 psi) class), is used for some body structural components on certain models.

Ultra High Tensile Strength Sheet

- Refer to 4.Access to the occupants (P77) for the vehicle cutting procedure.

Carbon Fiber Reinforced Plastic (CFRP)

- Lightweight and highly rigid Carbon Fiber Reinforced Plastic (CFRP) is used for some body structural parts of certain models.
- CFRP can be cut and deformed using cutters for rescue operations.

WARNING

- Cutting CFRP using a grinder or a saw will create carbon fiber dust. Wear appropriate protective equipment such as a dust mask and safety gloves when cutting CFRP.
- CFRP is conductive. If carbon fiber dust attaches to an electrical circuit, a short circuit may result. Keep electrical circuits free from carbon fiber dust when cutting CFRP.

Window Glass

- Laminated glass and tempered glass are widely used for vehicle windows.

* Laminated glass is mainly used for the windshield. It is also used for the door glass on some vehicles.

- Tempered glass is mainly used for the door glass, the roof glass and the back window glass.

*A

*B

*A	Laminated Glass Applications	*B	Tempered Glass Applications		
*1	Windshield	*2	Door Glass	*3	Back Window Glass

- Laminated glass and tempered glass are indicated respectively by “LAMISAFE” or “TEMPERLITE” printed on glass.

Laminated Glass

- Laminated glass consists of 2 layers of glass with a film in-between. Objects that strike the glass are less like to penetrate the glass and glass shards tend to remain adhered to the film.

*A	LAMISAFE Structure
*B	Broken Laminated Glass
*1	Glass
*2	Film

Tempered Glass

- Tempered glass is heated to near softening temperature, then rapidly cooled down to make it 3 to 5 times stronger than normal glass. When tempered glass is broken, it will break into very small pieces.

NOTICE

- Laminated glass consists of 2 layers of glass bonded together with a film. It does not break easily even when struck by an object.

Front Seat

- Two types of front seats, a manual seat and a power seat, are available. When adjusting the seat position, a lever or a knob is operated for the manual seat and a switch is operated for the power seat.

*1

*2

*1	Manual Seat	*2	Power Seat
----	-------------	----	------------

Manual Seat

- The seat can be moved forward/backward by lifting the slide lever (slide adjustment).
- The seatback can be tilted forward/backward by lifting the reclining lever (reclining adjustment).
- The seat cushion can be raised/lowered by repeatedly pulling up/pushing down on the lever (lifter adjustment).
- The front end of the seat cushion can be raised/lowered by turning the vertical knob (front vertical adjustment).

*1	Reclining Lever	*2	Lifter Lever
*3	Vertical Knob	*4	Slide Lever
*5	Slide Adjustment	*6	Lifter Adjustment
*7	Front Vertical Adjustment	*8	Reclining Adjustment

Power Seat

- The seat can be moved forward/backward using the slide function of the power seat switch (slide adjustment).
- The entire seat cushion can be raised/lowered using the lifter function of the power seat switch (lifter adjustment).
- The front end of the seat cushion can be raised/lowered using the front vertical function of the power seat switch (front vertical adjustment).
- The seatback can be tilted forward/backward by operating the reclining adjustment switch (reclining adjustment).
- The lumbar support position can be moved forward/backward by operating the lumbar support adjustment switch (lumbar support adjustment).
- The side support position can be moved right/left by operating the side support position adjustment switch (side support adjustment).
- The pelvic support position can be moved forward/backward by operating the pelvic support position adjustment switch (pelvic support adjustment).
- The shoulder support position can be moved forward/backward by operating the shoulder support position adjustment switch (shoulder support adjustment).
- The length of the seat cushion can be adjusted by operating the cushion length adjustment switch (cushion length adjustment).

Front Seat

*1	Reclining Adjustment	*2	Side Support Adjustment	*3	Pelvic Support Adjustment
*4	Slide Adjustment	*5	Shoulder Support Adjustment	*6	Lumbar Support Adjustment
*7	Side Support Adjustment	*8	Lifter Adjustment	*9	Front Vertical Adjustment
*10	Cushion Length Adjustment	*11	Shoulder Support Adjustment Switch	*12	Side Support Adjustment Switch
*13	Cushion Length Adjustment Switch	*14	Front Vertical Adjustment	*15	Power Seat Switch
*16	Slide Adjustment	*17	Lifter Adjustment	*18	Reclining Adjustment Switch
*19	Pelvic Support Adjustment Switch	*20	Lumbar Support Adjustment Switch		

NOTICE

■ The seat position adjustment functions of a power seat will be disabled when the 12 V battery is disconnected.

- When a vehicle is equipped with the driving position memory function, the driver seat automatically moves backward when the power switch is turned off (auto away function) and moves forward when the power switch is turned on (IG) (auto return function). Whether or not the vehicle is equipped with the driving position memory function can be confirmed by the existence of memory switches in the upper door trim.

*1

Seat Memory Switch

Rear Seat

- Two types of rear seats, a manual seat and a power seat, are available. When adjusting the seat position, a lever or a knob is operated for the manual seat and a switch is operated for the power seat.

Manual Seat

- The seat can be moved forward/backward by lifting the slide lever (slide adjustment).
- The seatback can be tilted forward/backward by lifting the reclining lever (reclining adjustment).
- The seat can be tilted forward by pulling the reclining strap.
- The seat can be moved leftward/rightward by lifting the lateral slide handle (lateral slide adjustment).
- The ottoman can be raised/lowered by lifting the ottoman lock handle (ottoman angle adjustment).
- The seat can be turned around by operating the swivel lever.

Rear Seat

*a	Reclining Adjustment	*b	Slide Adjustment	*c	Lateral Slide Adjustment

*7	Swivel Lever				

Power Seat

- The seat can be moved forward/backward by operating the slide adjustment switch (slide adjustment).
- The seatback can be tilted forward/backward by operating the reclining adjustment switch (reclining adjustment).
- The ottoman can be raised/lowered by operating the ottoman angle switch (ottoman angle adjustment).
- The angle of the upper seatback can be adjusted vertically by operating the seatback bend angle switch (seatback bend angle adjustment).
- The headrest can be raised/lowered by operating the headrest vertical adjustment switch (headrest vertical adjustment).

*a	Headrest Vertical Adjustment	*b	Seatback Bend Angle Adjustment	*c	Reclining Adjustment
*d	Slide Adjustment	*e	Ottoman Angle Adjustment		
*1	Headrest Vertical Adjustment Switch	*2	Seatback Bend Angle Adjustment Switch	*3	Reclining Adjustment Switch
*4	Slide Adjustment Switch	*5	Ottoman Angle Adjustment Switch	*6	Seat Select Switch

Headrest

- The position of the headrests can be adjusted vertically and horizontally.
- Two types of headrests, a manual headrest and a power headrest, are available. Vertical adjustment of the headrest is performed by hand on manual headrests or by operating a switch on power headrests. Horizontal adjustment can be performed by hand only.

Manual Headrest

- When raising a manual headrest, pull up the headrest by hand. When lowering, push down the headrest while pushing the release button. To remove the headrest, pull out the headrest while pushing the release button.

*1

Release Button

NOTICE

- If the headrest cannot be removed by pushing the release button, insert a screwdriver into the release hole provided on the opposite side of the headrest from the release button to release the lock and pull out the headrest.

*1

Release Button

*2

Release Hole

Power Headrest

- When raising a power headrest, raise/lower the headrest by operating the power seat switch located on the side of the seat.

*1 Power Seat Switch

NOTICE

- To remove the headrest, disengage the pins located inside the seatback and pull out the headrest.

*1 Back of the Seatback

Active Headrest System

- The active headrest system is built into the front headrests.
- The active headrest system consists of an inflator, a rod and a link mechanism.
- When the airbag sensor detects a rear impact, an ignition signal is sent to the inflators to activate the active headrest system. When an inflator is ignited, pressure inside the inflator rises, pushing up a piston. As the piston rises, the rod in the headrest stay is pushed up, a lock is released via the link mechanism and the headrest is pushed forward by a spring, helping reduce the possibility of whiplash injuries.

*1	Link Mechanism	*2	Rod
*3	Piston	*4	Inflator

- The active headrest system may remain powered for up to 90 seconds after the vehicle is shut off and disabled (see page 64). Wait at least 90 seconds before starting any operation. Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from unintentional actuation of the active headrest.
- If an inflator is cut, the active headrest inflator may unintentionally deploy. To prevent serious injury or death from unintentional active headrest actuation, avoid breaching the inflators.

Tilt & Telescopic Steering

- The steering column has a tilt mechanism, which enables vertical adjustment of the steering wheel position, and a telescopic mechanism, which enables horizontal adjustment of the steering wheel position.
- Two types of tilt & telescopic steering, manual tilt & telescopic steering and power tilt & telescopic steering, are available. When adjusting the position of the steering wheel, a lever is operated for the manual tilt and telescopic mechanisms and a switch is operated for the power tilt and telescopic mechanisms.
- Some vehicles have only tilt or telescopic mechanism, not both. Also, some vehicles have a fixed type steering column (not equipped with tilt & telescopic mechanism), and some vehicles power mechanism is only for tilt or telescopic function.

Manual Tilt & Telescopic

- The manual tilt & telescopic steering is provided with a lock lever under or side of steering column for releasing the lock when adjusting the steering wheel position.
- When the lock lever is operated, the lock is released, allowing adjustment of the steering wheel position. After adjustment, the steering wheel can be locked in the desired position by returning the lock lever.

*1 Steering Column

*2 Lock Lever

Power Tilt & Telescopic

- The power tilt & telescopic steering is provided with a switch on the steering column for adjusting the steering wheel position.
- The steering wheel can be moved to a desired position by operating the switch.

*A	Telescopic Mechanism	*B	Tilt Mechanism
*1	Steering Column	*2	Steering Wheel Adjustment Switch

Emergency Response Key Points

- Procedures and points to be noted when handling TOYOTA/LEXUS vehicles during emergency response are provided in this section.
- Refer to the Rescue Sheet for each model for model specific information such as vehicle identification points, component locations, etc.

Access Occupants

- Make sure that the vehicle is immobilized and disabled (see page 64), then open or remove windows and doors to access patients.
- Secure the necessary space for performing operations by adjusting the position of the steering wheel and seats and removing the head rests.

WARNING

- The SRS airbags, seat belt pretensioners, pedestrian protection active system and active headrests may remain powered for up to 90 seconds after the vehicle is shut off and disabled (see page 64). Wait at least 90 seconds before starting any operation. Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from unintentional deployment of the SRS airbags or unintentional actuation of the seat belt pretensioners, pedestrian protection active system or active headrests.
- Depending on the circumstances surrounding a collision, such as vehicle speed, point of impact, occupant detection etc., the SRS airbags, seat belt pretensioners, pedestrian protection active system or active headrests will not always be activated and may remain active. If an unactivated inflator of these systems is cut, the powder inside the inflator may ignite resulting in airbag deployment. To prevent serious injury or death from unintentional SRS airbag deployment or unintentional actuation of the seat belt pretensioners, pedestrian protection active system or active headrests, avoid breaching the inflators.
- Immediately after an SRS airbag is deployed or a seat belt pretensioners, the pedestrian protection active system or an active headrest is actuated, the components are extremely hot and may cause burns if touched.
- If an SRS airbag deploys with all doors and windows closed, inflation gas may cause breathing difficulty.
- If residue that is produced during the operation of SRS airbags, seat belt pretensioners, pedestrian protection active system or active headrests comes in contact with skin, rinse it off immediately to prevent skin irritation.

Vehicle with High Voltage Battery

- Hybrid vehicles (HEV), plug-in hybrid vehicles (PHEV), electric vehicles (BEV) and fuel cell vehicles (FCEV) are equipped with a high voltage electrical system (120 to 800 V).

- The high voltage system may remain charged for up to 10 minutes after the vehicle is shut off and disabled (see page 64). Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from severe burns and electric shock from the high voltage electrical system.
- To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component. Wear appropriate protective equipment such as insulated gloves when there is a risk of touching high voltage power cables or high voltage components.

Vehicle with Hydrogen Gas

- Fuel cell vehicles (FCEV) carry compressed hydrogen gas.

- Hydrogen gas is colorless, odorless and flammable.
- Compared to gasoline or natural gas, hydrogen gas can ignite in a wide range of concentrations (4 to 74.5%). If the sound of hydrogen leaking (a loud hissing sound) can be heard when working on the vehicle, or if the hydrogen concentration around the vehicle exceeds 1% when measured with a hydrogen concentration detector, immediately step away from the vehicle as there is a chance that the hydrogen gas may ignite.
- Even after the vehicle is stopped (see page 64), hydrogen remains inside the FC stack, hydrogen tanks and other hydrogen-related parts, as well as inside the hydrogen pipe. In order to avoid fires and explosions, never cut or damage these hydrogen-related parts or the hydrogen pipe.
- If there is any hydrogen leakage, do not use any electrical or rescue equipment that may produce static electricity, as this may ignite the hydrogen.

Cut Vehicle

- Pay special attention to the location of structural reinforcements, fuel system, SRS and high voltage electrical system components when cutting a vehicle.
- Refer to the Rescue Sheet for each model for model specific information such as component locations, etc.

*a	Structural Reinforcements	*b	High Voltage Electrical System Components
*c	SRS Components	*d	Fuel System Components

WARNING

- To prevent serious injury from a fire caused by sparks, use a hydraulic cutter or other tools that do not generate sparks when cutting the vehicle.

- If the SRS airbag, seat belt pretensioner, pedestrian protection active system or active headrest has already been activated, the inflator can be cut.

Components Requiring Special Attention

- The construction and functions of components requiring special attention during emergency response are described in this section.

Battery low voltage

12 V Battery

- The 12 V battery supplies power to the ECUs that control various systems and auxiliary components such as the power door lock, power window, power tilt and telescopic steering, power seat, etc.
- To ensure safe emergency response operations, it is necessary to completely shut off the vehicle (see page 64). Disconnect the negative battery terminal from the 12 V battery before performing work and shut off the power to the electrical system to prevent electrical fires and to keep the vehicle from starting.
- 12 V battery electrolyte contains dilute sulfuric acid.
- Depending on the model the 12 V battery is installed in the engine compartment, luggage compartment, under the rear seats, etc.
- Refer to the Rescue Sheet for each model for locations of the 12 V battery.

*a	Engine Compartment	*b	Luggage Compartment
*c	Under Rear Seat		

WARNING

- There is a possibility of explosion due to ignition of the hydrogen gas generated from the 12 V battery. Therefore, do not allow any open sparks or open flames nearby the 12 V battery.
- Dilute sulfuric acid may cause irritation of the skin if contacted. Wear appropriate protective equipment such as rubber gloves and safety goggles when there is a risk of touching electrolyte.

NOTICE

- Once the 12 V battery is disconnected (see page 64), power controls will not operate. To facilitate emergency response operations, lower the windows, open the back door, unlock the doors and take other necessary actions before shutting off the vehicle.
- 12 V battery electrolyte contains ingredients that damage painted surfaces. If any comes in contact with the vehicle body, discoloration or other damage may occur.

Sub-battery

- A sub-battery is installed in vehicles equipped with an electro shiftmatic system and advanced drive system.
- Dual systemization of the 12 V battery power supply enables the parking brake lock operation and advanced drive control when the 12 V battery malfunctions.
- By disconnecting the negative (-) terminal of the 12 V battery and shutting of the electricity for 10 minutes or more, the protection relay inside the sub-battery is released and the voltage drops to 0 V.
- One sub-battery is a nickel-metal hydride (Ni-MH) battery, and the other is a lithium ion (Li-ion) battery.
- The nickel-metal hydride (Ni-MH) sub-battery consists of 10 1.2 V nickel-metal hydride automotive batteries connected in series, ensuring a 12 V power source.
- The lithium ion (Li-ion) sub-battery consists of four 3.7 V lithium ion automotive batteries connected in series, ensuring a 12 V power source.
- The Ni-MH battery contains a strong alkaline electrolyte (pH 13.5). The electrolyte is absorbed in the cell plates, but it may leak in case of damages to the high voltage battery. However, it would not be a large amount.
- The Li-ion battery electrolyte, mainly consisted of carbonate ester, is a flammable organic electrolyte. The electrolyte is absorbed into the electrodes and the separators. It may leak in case of damages to the high voltage battery, but it would not be a large amount.

*1 Sub-battery

WARNING

- There is a possibility of explosion due to ignition of the hydrogen gas generated from the sub-battery. Therefore, do not allow any open sparks or open flames nearby the sub-battery.
- The strong alkaline (pH 13.5) potassium hydroxide water solution contained in the nickel-metal hydride (Ni-MH) battery is harmful to the human body. In cases where touching the electrolyte is unavoidable or there is a danger of it being touched, perform work wearing appropriate protective equipment such as rubber gloves and safety goggles.
- The flammable organic electrolyte in the lithium ion (Li-on) battery primarily contains carbonate ester and is harmful to the human body. In case of contact with the electrolyte, it may irritate the eyes, nose, throat, and skin. In case of contact with the smoke or vapor from leaked electrolyte or a burning battery, it may irritate the eyes, nose, or throat. In cases where touching the electrolyte is unavoidable or there is a danger of it being touched, perform work wearing appropriate protective equipment such as rubber gloves, safety goggles, a protective mask, or a self-contained breathing apparatus (SCBA).
- If electrolyte leaks from the lithium ion (Li-on) battery, keep it away from fire and ensure the area is well ventilated. Absorb the electrolyte with a cloth or equivalent absorbing material and keep it in an airtight container.

NOTICE

- After the negative (-) terminal of the 12 V battery has been disconnected and the power has been shut off, approximately 12 V is maintained between the positive (+) terminal and negative (-) terminal of the sub-battery for up to approximately 10 minutes.

Ultra-capacitor, low-voltage

- The ultra-capacitor, low-voltage is installed inside the center console.
- By using an internal condenser, the supply of power is ensured.
- For the detailed installation locations of ultra-capacitor, low-voltage for each model, refer to the Rescue Sheet for each model.

*1 ultra-capacitor, low-voltage

NOTICE

- After the negative (-) terminal of the 12 V battery has been disconnected and the power has been shut off, approximately 12 V is maintained between the positive (+) terminal and negative (-) terminal of the ultra-capacitor, low-voltage for up to approximately 10 minutes.

High Voltage System

High Voltage Battery

- The high voltage battery for the motor stores high voltage electricity (120 to 800 V). Depending on the model the battery is installed in the luggage compartment, under the rear seats, under the center console or under the floor.

*1	Luggage Compartment	*2	Under Rear Seat
*3	Under Center Console	*4	Undercarriage

- An under-hood label shows the location of the high voltage battery.

■ A Nickel-metal hydride (Ni-MH) battery or lithium ion (Li-ion) battery is used as the high voltage battery.

1. Nickel-metal hydride (Ni-MH) battery

- These batteries consist of multiple modules, each module consisting of six 1.2 V cells, connected in series to obtain a high voltage (120 to 400 V).
- The battery modules are sealed in a case and cannot easily be touched.
- The Ni-MH battery contains a strong alkaline electrolyte (pH 13.5). The electrolyte, however, is absorbed in the cell plates and will not normally spill or leak out even if a battery module is cracked.
- Electrolyte leakage from the HV battery pack is unlikely due to its construction and the amount of available electrolyte contained within the Ni-MH modules. Any spillage would not warrant a declaration as a hazardous material incident.

*1 Battery Module

WARNING

■ Strong alkaline electrolyte (pH 13.5) is harmful to the human body. To avoid injury by coming in contact with the electrolyte, wear appropriate protective equipment such as rubber gloves and safety goggles when there is a risk of touching electrolyte.

2. Lithium ion (Li-ion) battery

- Li-ion batteries consist of multiple stacks. Each stack consists of multiple cells, and the stacks are connected in series to obtain high voltage (120 to 800 V).
- The battery cells are sealed in a case and cannot easily be touched.
- The Li-ion battery electrolyte, mainly consisted of carbonate ester, is a flammable organic electrolyte. The electrolyte is absorbed into the battery cell separators, even if the battery cells are crushed or cracked, it is unlikely that liquid electrolyte will leak.
- Any liquid electrolyte that leaks from a Li-ion battery cell quickly evaporates.

*1 Battery Stack

WARNING

- The flammable organic electrolyte which primarily contains carbonate ester is harmful to the human body. In case of contact with the electrolyte, it may irritate the eyes, nose, throat and skin. In case of contact with the smoke or vapor from leaked electrolyte or a burning battery, it may irritate the eyes, nose or throat. To avoid injury by coming in contact with the electrolyte or vapor, wear appropriate protective equipment such as rubber gloves, safety goggles, protective mask or SCBA when there is a risk of touching electrolyte.
- If the electrolyte spills, keep it away from fire and ensure the area is well ventilated. Absorb the electrolyte with a waste cloth or equivalent absorbing material and keep it in an airtight container until disposed of.

Fuel Cell (FC) System

FC Stack

- The FC stack is a device to generate electricity through the chemical reaction between hydrogen and oxygen. Using the hydrogen supplied by the hydrogen tank and oxygen in the air drawn in from outside the vehicle, a high voltage of 200 V or higher is generated.
- The FC stack generates power using so called “cells”, which are comprised of an electrolyte membrane sandwiched by separators. A few hundred cells are connected in a row to generate a high voltage.
- The cells are sealed in a case and cannot easily be touched.
- Water is generated through the chemical reaction between hydrogen and oxygen during power generation, and discharged via the discharge outlet.

*1	FC Stack	*2	Cell
----	----------	----	------

- An under-hood label shows the location of the FC stack.

Hydrogen Tank

- The hydrogen tanks are filled with high pressure hydrogen gas (a maximum of 70 MPa (714 kgf/cm², 10,153 psi) at 15°C (59°F)) that is supplied to the FC stack.
- The hydrogen tanks are made of carbon fiber-reinforced plastic and located underneath the floor.
- The hydrogen detector used to detect hydrogen leaks is located near the tanks. If a specified concentration of hydrogen leakage is detected, the FC system cuts off the supply of hydrogen.
- Each tank is equipped with a thermal pressure relief device (TPRD) in order to prevent an explosion when the temperature of the hydrogen reaches abnormal levels due to a vehicle fire. The pressure relief device will open at approximately 110°C (230°F) to release the hydrogen gas in the tank outside of the vehicle.

*A	View A		
*1	Hydrogen Tanks	*2	Tank Valve
*3	Thermal Pressure Relief Device (TPRD)		
*a	Front of Vehicle	*b	Jet Angle

NOTICE

- Depending on the model, multiple hydrogen tanks may be installed. For the detailed installation locations of hydrogen tanks for each model, refer to the Rescue Sheet for each model.

Hydrogen Pipes

- The hydrogen pipes connect the hydrogen-related parts such as the FC stack and hydrogen tanks.
- The hydrogen pipes are located underneath the floor.
- Some of the high-pressure hydrogen pipes are identified in red.

*1	Hydrogen Pipes
----	----------------

Hydrogen Pump

- The hydrogen pump circulates the hydrogen supplied from the hydrogen tanks into the FC stack.
- The hydrogen pump has a built-in motor that is operated using the high voltage from the FC water pump and hydrogen pump inverter. The hydrogen pump is installed underneath a cover at the side of the FC stack.

*1	Hydrogen Pump
----	---------------

CNG Tank

- The Compressed Natural Gas (CNG) tank is filled with compressed natural gas that is used as fuel for the engine at a maximum pressure of 20 MPa (204 kgf/cm², 2,900 psi).
- The CNG tank is made of metal and located in the luggage compartment, etc.
- The CNG tank is equipped with a pressure relief device (PRD) in order to prevent an explosion when the temperature of the natural gas reaches abnormal levels due to a vehicle fire. The pressure relief device will open at approximately 110°C (230°F) to release the natural gas in the tank outside of the vehicle.
- Natural gas is flammable and can ignite within a concentration of 5.3 to 15.0%.
- Natural gas mainly consists of methane, is harmless and diffuses upwards as it is lighter than air. Also, the gas is infused with a smell so that a leak can be quickly detected.

*1	CNG Tank	*2	Pressure Relief Device (PRD)
----	----------	----	------------------------------

WARNING

- If the sound of natural gas leaking (a loud hissing sound) can be heard when working on the vehicle, or if the smell of natural gas is present, immediately step away from the vehicle as there is a chance that the natural gas may ignite.

LPG Tank

- The Liquefied Petroleum Gas (LPG) tank is filled with compressed liquefied propane, butane, etc. that is used as fuel for the engine at a pressure of 1 MPa (10.2 kgf/cm², 145 psi) or less.
- The LPG tank is made of metal and located in the luggage compartment, etc.
- The LPG tank is equipped with a pressure relief device (PRD) in order to prevent an explosion when the pressure of the LPG reaches abnormal levels due to a vehicle fire. The pressure relief device will open when the pressure in the tank reaches a certain pressure to release the gas in the tank outside the vehicle.
- LPG is flammable and can ignite within a concentration of 2.4 to 9.5%.
- The main components of LPG, propane and butane are harmless and remain close to the ground as they are heavier than air. Also, the gas is infused with a smell so that a leak can be quickly detected.

LPG Tank

WARNING

- If the sound of LPG leaking (a loud hissing sound) can be heard when working on the vehicle, or if the smell of LPG is present, immediately step away from the vehicle as there is a chance that the LPG may ignite.

Air Tank

- The air tank stores compressed air required for vehicle height adjustment.
- The air tank is made of metal and installed in spaces such as under the luggage room.

*1	Air Tank
----	----------

Urea Selective Catalytic Reduction (SCR) System

- The urea Selective Catalytic Reduction (SCR) system reduces harmful nitrogen oxides (NOx) in the exhaust gas using a urea solution (AdBlue).
- The urea solution (AdBlue) is stored in the urea tank installed below the floor, etc.
- The urea solution (AdBlue) is a colorless, odorless and harmless liquid. However, when the temperature is high, such as in the summer, there is a possibility that an irritating odor is produced by the thermolysis of urea solution (AdBlue).
- The urea solution (AdBlue) is noncombustible. However, if the urea solution (AdBlue) is heated due to a fire, etc., it breaks down and may emit a harmful gas.

*1 Urea Tank

WARNING

- If you come in contact with smoke or vapor from a burning urea tank, it may irritate the eyes, nose or throat. To avoid injury by coming in contact with the smoke or vapor from a burning urea tank, wear appropriate protective equipment such as rubber gloves, safety goggles, a protective mask or SCBA when there is a risk of contacting the smoke or vapor.

Emergency Response Key Points

- Procedures and points to be noted when handling TOYOTA/LEXUS vehicles during emergency response are provided in this section.
- Refer to the Rescue Sheet for each model for model specific information such as vehicle identification points, component locations, etc.

Spills

- Vehicles contain various fluids such as gasoline, coolant, engine oil, transmission oil, brake fluid, power steering fluid, window washer fluid and 12 V battery electrolyte.

Coolant

- Long Life Coolant (LLC) that is used to cool the engine and inverter contains ethylene glycol for freezing temperature control and anticorrosion additives for preventing metal components from corroding.

Lubrication Oil

- Engine oil, transmission oil and gear oil are used for lubrication and contain mineral oils and synthetic oils.

Brake Fluid

- Brake fluid contains several types of glycol-ether and anticorrosion additives for preventing metal components from corroding.

- Brake fluid contains ingredients that damage painted surfaces. If any comes in contact with the vehicle body, the paint may come off.

Power Steering Fluid

- Power steering fluid contain mineral oils and synthetic oils.

Window Washer Fluid

- Window washer fluid contains alcohol for freezing temperature control.

12 V Battery Electrolyte

- 12 V battery electrolyte contains dilute sulfuric acid.

- Dilute sulfuric acid may cause irritation of the skin if contacted. Wear appropriate protective equipment such as rubber gloves and safety goggles when there is a risk of touching electrolyte.

- 12 V battery electrolyte contains ingredients that damage painted surfaces. If any comes in contact with the vehicle body, discoloration or other damage may occur.

Sub-battery Electrolyte

- There are 2 types of high voltage battery; the nickel-metal hydride type and the lithium ion type.

1. Nickel-metal hydride (Ni-MH) battery

- The Ni-MH battery contains a strong alkaline electrolyte (pH 13.5). The electrolyte is absorbed in the cell plates, but it may leak in case of damages to the high voltage battery. However, it would not be a large amount.

- Strong alkaline (pH 13.5) potassium hydroxide water solution is harmful to the human body. In cases where touching the electrolyte is unavoidable or there is a danger of it being touched, perform work wearing appropriate protective equipment such as rubber gloves and protective glasses.

2. Lithium ion (Li-ion) battery

- The Li-ion battery electrolyte, mainly consisted of carbonate ester, is a flammable organic electrolyte. The electrolyte is absorbed into the electrodes and the separators. It may leak in case of damages to the high voltage battery, but it would not be a large amount.
- Electrolyte will quickly evaporate if leaked from the battery cell.

WARNING

- The flammable organic electrolyte which primarily contains carbonate ester is harmful to the human body. In case of contact with the electrolyte, it may irritate the eyes, nose, throat and skin. In case of contact with the smoke or vapor from leaked electrolyte or a burning battery, it may irritate the eyes, nose or throat. To avoid injury caused by coming in contact with the electrolyte or the vapor, wear appropriate protective equipment such as rubber gloves, safety goggles, protective mask or SCBA when there is a risk of touching electrolyte.
- If the electrolyte is spilled, keep it away from fire and ensure the area is well ventilated. Absorb the electrolyte with a piece of cloth or equivalent absorbent material, and keep it in an airtight container for proper disposal.

48V Battery Electrolyte

- A Li-ion battery is used for the 48V battery.

- The Li-ion battery electrolyte, mainly consisted of carbonate ester, is a flammable organic electrolyte. The electrolyte is absorbed into the electrodes and the separators. It may leak in case of damages to the 48V battery, but it would not be a large amount.
- Electrolyte will quickly evaporate if leaked from the battery cell.

WARNING

- The flammable organic electrolyte which primarily contains carbonate ester is harmful to the human body. In case of contact with the electrolyte, it may irritate the eyes, nose, throat and skin. In case of contact with the smoke or vapor from leaked electrolyte or a burning battery, it may irritate the eyes, nose or throat. To avoid injury caused by coming in contact with the electrolyte or the vapor, wear appropriate protective equipment such as rubber gloves, safety goggles, protective mask or SCBA when there is a risk of touching electrolyte.
- If the electrolyte is spilled, keep it away from fire and ensure the area is well ventilated. Absorb the electrolyte with a piece of cloth or equivalent absorbent material, and keep it in an airtight container for proper disposal.

Vehicle with High Voltage Battery

- There are 2 types of high voltage battery; the nickel-metal hydride type and the lithium ion type.

1. Nickel-metal hydride (Ni-MH) battery

- The Ni-MH battery contains a strong alkaline electrolyte (pH 13.5). The electrolyte is absorbed in the cell plates, but it may leak in case of damages to the high voltage battery. However, it would not be a large amount.
- Electrolyte leakage from the HV battery pack is unlikely considering the battery construction and the amount of electrolyte inside the module.

- Strong alkaline electrolyte (pH 13.5) is harmful to the human body. To avoid injury by coming in contact with the electrolyte, wear appropriate protective equipment such as rubber gloves and safety goggles when there is a risk of touching electrolyte.

2. Lithium ion (Li-ion) battery

- The Li-ion battery electrolyte, mainly consisted of carbonate ester, is a flammable organic electrolyte. The electrolyte is absorbed into the electrodes and the separators. It may leak in case of damages to the high voltage battery, but it would not be a large amount.
- Electrolyte will quickly evaporate if leaked from the battery cell.

- The flammable organic electrolyte which primarily contains carbonate ester is harmful to the human body. In case of contact with the electrolyte, it may irritate the eyes, nose, throat and skin. In case of contact with the smoke or vapor from leaked electrolyte or a burning battery, it may irritate the eyes, nose or throat. To avoid injury caused by coming in contact with the electrolyte or the vapor, wear appropriate protective equipment such as rubber gloves, safety goggles, protective mask or SCBA when there is a risk of touching electrolyte.
- If the electrolyte is spilled, keep it away from fire and ensure the area is well ventilated. Absorb the electrolyte with a piece of cloth or equivalent absorbent material, and keep it in an airtight container for proper disposal.

Traction Battery Coolant

- Traction battery coolant contains ethylene glycol for freezing temperature control and anticorrosion additives for preventing metal components from corroding.
- As coolant is used as the cooling method for the high voltage battery, a coolant leak in the high voltage section during an accident, malfunction, etc., could result in a short circuit or similar possibly leading to battery overheating and the emission of fumes. For this reason, a coolant which resists the flow of electricity is used for the cooling system of the traction battery.
- As the coolant is different to traditional engine coolant (pink color), an orange color is used in order to be the same as high voltage systems.

Vehicle with Solar Battery

- A strong alkaline (pH 13.5) potassium hydroxide water solution is used as the solar battery electrolyte. The electrolyte is soaked into non-woven fabric. However, if the solar battery is damaged in any way, it may leak. However, there is no risk of a mass leak.
- Electrolyte leakage from the solar battery is unlikely due to its construction and the amount of available electrolyte contained within the Ni-MH modules. Any spillage would not warrant a declaration as a hazardous material incident.

- Strong alkaline electrolyte (pH 13.5) is harmful to the human body. To avoid injury by coming in contact with the electrolyte, wear appropriate protective equipment such as rubber gloves and safety goggles when there is a risk of touching electrolyte.

Vehicle with Urea Solution

- Urea solution equipped vehicles have a urea tank that stores urea solution (AdBlue).
- The urea solution (AdBlue) is a harmless noncombustible liquid. However, if the urea solution (AdBlue) is heated due to a fire, etc., it breaks down and may emit a harmful gas.

WARNING

- If you come in contact with smoke or vapor from a burning urea tank, it may irritate the eyes, nose or throat. To avoid injury by coming in contact with the smoke or vapor from a burning urea tank, wear appropriate protective equipment such as rubber gloves, safety goggles, a protective mask or SCBA when there is a risk of contacting the smoke or vapor.

Vehicle with Hydrogen Gas

- The FC stack coolant used to cool the FC stack, etc. is colorless and transparent and contains ethylene glycol in order to lower the freezing point.

Gas Leaks

- There are various types of gas used in vehicles. For example, there is nitrogen (N₂) gas used in gas filled dampers, refrigerant gas for air conditioners, and CNG, LPG and hydrogen gas.

Nitrogen (N₂) Gas

- Nitrogen (N₂) is used in gas filled dampers.
- The gas is colorless, odorless, and harmless.

Refrigerant Gas

- The refrigerant gas used in air conditioner is R-134a or R-1234yf.
- The gas is containing carbon and fluorine.
- The gas is colorless, odorless, and harmless.

Vehicle with CNG

- Compressed Natural Gas (CNG) is a flammable gas that mainly contains methane.
- The gas is colorless and harmless.
- The gas is infused with a smell so that a leak can be quickly detected.

- If the sound of natural gas leaking (a loud hissing sound) can be heard when working on the vehicle, or if the smell of natural gas is present, immediately step away from the vehicle as there is a chance that the natural gas may ignite.

Vehicle with LPG

- Liquefied Petroleum Gas (LPG) is a flammable gas that mainly contains propane and butane.
- The gas is colorless and harmless.
- The gas is infused with a smell so that a leak can be quickly detected.

WARNING

- If the sound of LPG leaking (a loud hissing sound) can be heard when working on the vehicle, or if the smell of LPG is present, immediately step away from the vehicle as there is a chance that the LPG may ignite.

Vehicle with Hydrogen Gas

- Hydrogen gas is a flammable gas.
- The gas is colorless, odorless, and harmless.

WARNING

- If the sound of hydrogen leaking (a loud hissing sound) can be heard when working on the vehicle, or if the hydrogen concentration around the vehicle exceeds 1% when measured with a hydrogen concentration detector, immediately step away from the vehicle as there is a chance that the hydrogen gas may ignite.

Emergency Response Key Points

- Procedures and points to be noted when handling TOYOTA/LEXUS vehicles during emergency response are provided in this section.
- With regards to the pictograms used, refer to chapter 10. Explanation of pictograms used (P177)

Fire

- During the initial attack on a fire, extinguish the fire with copious amounts of water. This will also cool down the vehicle.

- Plastic and other components will generate toxic gases when they melt. Wear appropriate protective equipment such as a protective mask when extinguishing a fire.

Fire Extinguisher

- Water has been proven to be a suitable extinguishing agent.
- Also use a fire extinguisher suitable for flammable liquid fires (burning of gasoline, grease, oil, etc.) and electrical fires (burning of electrical wiring, electric devices, etc.) as well as general fires (burning of solid objects, etc.).

Vehicle with High Voltage Battery

- Hybrid vehicles (HEV), plug-in hybrid vehicles (PHEV), electric vehicles (BEV) and fuel cell vehicles (FCEV) are equipped with a high voltage battery.
- Battery fires should be extinguished by directing the smoke and flame emissions away from the vehicle.
- Extinguish the fire with copious amounts of water to cool down the high voltage battery.
- Water applied directly to the battery cells increases the cooling effect. Open a door or break the glass to extinguish the fire.
- Damaged cells in high-voltage batteries can lead to thermal runaway and reignition. To prevent thermal runaway and reignition, rescuers need to be aware of the risk of residual energy. The main cause of thermal runaway is a short circuit in a high-voltage battery cell and the resulting increase in the internal temperature of the cell. If thermal runaway occurs in one or more cells, it can spread to other cells in a domino effect.
- After an accident, energy remains within the undamaged high-voltage battery cells.
- Refer to the Rescue Sheet for each model for the high voltage battery location.

WARNING

- To avoid serious injury or death from severe burns or electric shock, never breach or remove the high voltage battery assembly cover under any circumstances, including fire.
- Do not attempt to puncture the high-voltage battery and pour water on it.
- If only a small amount of water is used to extinguish a fire, a short circuit may occur in the high voltage battery, causing the fire to reignite.

NOTICE

- It is recommended to allow the high voltage battery to burn itself out if it is judged that it is difficult to apply copious amounts of water to the high voltage battery.

Vehicle with Lithium ion (Li-ion) Battery

WARNING

- Burning Li-ion batteries may irritate the eyes, nose or throat. In case of contact with the vapor from the electrolyte, it may irritate the nose or throat. To avoid injury by coming in contact with the electrolyte or vapor, wear appropriate protective equipment such as rubber gloves, safety goggles, protective mask or SCBA when there is a risk of touching electrolyte.
- To prevent reignition, use a thermal imaging camera to ensure that the high-voltage battery is completely cooled after extinguishing the fire.

Vehicle with Urea Solution

- Urea solution equipped vehicles have a urea tank that stores urea solution (AdBlue).

WARNING

- The urea solution (AdBlue) is noncombustible. However, if the urea solution (AdBlue) is heated due to a fire, etc., it breaks down and may emit a harmful gas. If you come in contact with smoke or vapor from a burning urea tank, it may irritate the eyes, nose or throat.
- To avoid injury by coming in contact with the smoke or vapor from a burning urea tank, wear appropriate protective equipment such as rubber gloves, safety goggles, a protective mask or SCBA when there is a risk of contacting the smoke or vapor.

Vehicle with Hydrogen Gas

- Fuel cell vehicles (FCEV) carry compressed hydrogen gas.
- When dousing the vehicle, keep a distance of at least 10.0 meters (32.8 feet) in case of hydrogen igniting.
- Use larger amounts of water particularly on the vehicle's rear underfloor to cool the area where the hydrogen tanks are located.
- If the hydrogen is on fire, extinguishing the hydrogen flame completely could cause unburned hydrogen to accumulate and lead to a secondary explosion. Therefore, spray water to prevent the flame from spreading to surrounding areas, then wait for the hydrogen flame to naturally die down (burn itself out).
- In order to prevent an explosion when the temperature of the hydrogen reaches abnormal levels in case of a vehicle fire, the thermal pressure relief devices (TPRD) installed on the hydrogen tanks open when they exceed approximately 110°C (230°F), and the hydrogen inside the tank is released outside of the vehicle.
- A pure hydrogen fire is colorless and is not visible. However, in a vehicle fire, other flammable materials will also burn, allowing the fire to be visible.

- The temperature of a hydrogen fire itself is very high, but the amount of heat that radiates from the flame is small. It is unique in that it is difficult to feel the heat even in close proximity.

*1	Hydrogen Tank	*2	Thermal Pressure Relief Device (TPRD)	*3	Tank Valve
*a	Jet Angle				

- Hydrogen gas is colorless, odorless and flammable.
- Compared to gasoline or natural gas, hydrogen gas can ignite in a wide range of concentrations (4 to 74.5%). If the sound of hydrogen leaking (a loud hissing sound) can be heard when working on the vehicle, or if the hydrogen concentration around the vehicle exceeds 1% when measured with a hydrogen concentration detector, immediately step away from the vehicle as there is a chance that the hydrogen gas may ignite.

- Depending on the model, multiple hydrogen tanks may be installed. For the detailed installation locations of hydrogen tanks for each model, refer to the Rescue Sheet for each model.

Emergency Response Key Points

- Procedures and points to be noted when handling TOYOTA/LEXUS vehicles during emergency response are provided in this section.

Submersion

- Pull the vehicle out of water as much as possible. Immobilize the vehicle (see page 28) and disable the vehicle (see page 64) before starting any operation.
- Refer to 4. Access to the occupants (P77) for rescue procedures.

NOTICE

- A short circuit due to electrical corrosion (wiring and circuit boards become corroded due to an electrochemical reaction with water) may cause a vehicle fire after some time has elapsed.
- To prevent a vehicle fire, avoid turning the ignition switch or power switch of a submerged vehicle to ACC or ON.

Vehicle with High Voltage Battery

- A partially or fully submerged hybrid vehicle (HEV), plug-in hybrid vehicles (PHEV), electric vehicle (BEV) or fuel cell vehicle (FCEV) does not have high voltage potential on the metal vehicle body, and is safe to touch.
- It is safe to enter the water as the vehicle and water have the same electrical potential.

WARNING

- Touching exposed orange high voltage power cables or high voltage components such as the high voltage battery may cause electrical shock due to a change in electrical potential.
- To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component. Wear appropriate protective equipment such as insulated gloves when there is a risk of touching high voltage power cables or a high voltage components.

Damaged Vehicle Handling Key Points

- Points to be noted when handling damaged vehicles are provided in this section.

Towing Damaged Vehicle

- Loading a vehicle onto a car carrier (flat bed trailer) is the preferred method of towing.
- Only the FF (Front-engine Front-wheel drive) vehicles are available to tow with rear wheels on the ground.
- If towing the vehicle with all four wheels on the ground is unavoidable, release the parking lock, move the shift lever to neutral (N), and unlock the steering wheel first. The vehicle can then be towed at a low speed (below 30 km/h) for a distance of up to 80 km in a forward direction. (*Except vehicles with a high voltage battery. See page149 for details.)
- Refer to the illustrations on the following page for correct and incorrect methods of towing FF (Front-engine Front-wheel drive), FR (Front-engine Rear-wheel drive), MR (Mid-engine Rearwheel drive) and 4WD (Four Wheel Drive) vehicles.

WARNING

- When towing a vehicle with all four wheels on the ground, make sure the vehicle is in "Ignition-On" mode. If in "Off" mode, the steering wheel may lock, making the steering inoperative.
 - Vehicles equipped with the steer-by-wire system cannot be steered while the ignition switch is turned off because the steering wheel and the tires are in a free condition*.
- *The steering lock may be engaged in this condition.

NOTICE

- Exceeding the towing distance or speed limit when towing a vehicle with all four wheels on the ground or towing a vehicle with the vehicle facing backwards, may damage the transmission or transaxle.
- When the vehicle is equipped with a stop and start system, towing the vehicle with all four wheels on the ground may damage the system.

Parking Lock

- The parking lock can be released by moving the shift lever from park (P) to neutral (N) while pushing and holding the “lock release button” on the shift gate.

NOTICE

- The parking lock for vehicles equipped electric shift switches (vehicles with a P position switch) cannot be released while the 12 V negative (-) battery terminal is disconnected. When moving the vehicle, use a jack, etc.

Steering Wheel Lock

- The steering wheel can be unlocked by pushing the engine/power switch until in “Ignition-On” mode, or turning the ignition switch to any position other than “LOCK”.
- When it is difficult to release the lock, turn the steering wheel in either direction while pushing the engine/power switch or turning the key.

NOTICE

- When a vehicle is equipped with the electrical key transmitter system, the steering wheel cannot be unlocked if the negative (-) terminal of the 12 V battery is disconnected. Use wheel dollies or similar equipment when moving the vehicle.

Steer-by-Wire System

- The steer-by-wire system is a power steering system without a mechanical link between the steering wheel and the tires via intermediate shaft.
- It consists of a steering control actuator (STA) with an STA MCU and a worm and wheel reducer installed in the steering wheel and steering column, and steering control actuator (SCA) with an SCA MCU installed in the rack-parallel power steering gear. The STA and SCA are connected via CAN communication.
- When the ignition switch is turned off, the steering wheel and the tires will be in a free condition.

*1	Steering Wheel	*2	Steering Torque Actuator
*3	Steering Control Actuator	-	-

Precautions for FF (Front-engine Front-wheel drive) vehicle

- Tow the vehicle with the front wheels or all four wheels off the ground.

Precautions for FR (Front-engine Rear-wheel drive), MR (Mid-engine Rear-wheel drive) and 4WD (Four Wheel Drive) vehicles

- Tow the vehicle with all four wheels off the ground.

Vehicle with High Voltage Battery

- Make sure the negative (-) terminal of the 12 V battery is disconnected, then load the vehicle onto a car carrier (flat bed trailer).
- If towing the vehicle with all four wheels on the ground is unavoidable, only tow it for a short distance (such as to a car carrier (flat bed trailer)) in a forward direction at a low speed (below 30 km/h (18 mph)).
- Refer to the above illustrations for correct and incorrect methods of towing FF, FR and 4WD vehicles.

- Hybrid vehicles (HEV), plug-in hybrid vehicles (PHEV), electric vehicles (BEV) and fuel cell vehicles (FCEV) are equipped with a high voltage electrical system (120 to 800 V).
- To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component. Wear appropriate protective equipment such as insulated gloves when there is a risk of touching high voltage power cables or high voltage components.

- If hybrid vehicles (HEV), plug-in hybrid vehicles (PHEV), electric vehicles (BEV) or fuel cell vehicles (FCEV) are towed with the drive wheels on the ground, it could have adverse effects on the high voltage system and damage it.

Storing a Damaged Vehicle

- Drain gasoline, oil and other fluids, then disconnect the negative (-) terminal of the 12 V battery before storing a damaged vehicle.

Submerged Vehicle

- In addition to the normal procedures, remove the water from the vehicle.

NOTICE

- A vehicle that has been submerged in water poses a threat of vehicle fire after some time for possible short circuits due to electrical corrosion (wiring and circuit boards to corrode in an electrochemical reaction with water). To store a vehicle that has been submerged in water, choose a well-ventilated place at least 15 meters (49.2 feet) away from other objects.
- To prevent a vehicle fire, avoid turning the ignition switch or power switch of a submerged vehicle to ACC or ON.

Vehicle with High Voltage Battery

- In addition to the normal procedures, remove the service plug or interlock connector from the high voltage battery before storing a damaged vehicle.

WARNING

- The service plug is a high voltage component. Touching it without appropriate protective equipment may result in serious injury or death from severe burns and electric shock from the high voltage electrical system. Wear appropriate protective equipment such as insulated gloves when touching the service plug.
- The high voltage battery is still charged with high voltage electricity even after the vehicle is shut off, disabled (see page 64) and the service plug or interlock connector is removed from the high voltage battery.
- To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component. Wear appropriate protective equipment such as insulated gloves when there is a risk of touching high voltage power cables or high voltage components.
- When the person(s) in charge of handling the damaged vehicle is away from the vehicle, other person(s) may accidentally touch the vehicle and be electrocuted, resulting in severe injury or death. To avoid this danger, display a "HIGH VOLTAGE DO NOT TOUCH" sign to warn others (print and use page 12 of this guide).

NOTICE

- A high voltage battery may cause a vehicle fire after some time for possible short circuits inside due to the impact of collision or electrical corrosion. To store a vehicle equipped with a high voltage battery, choose a well-ventilated place at least 15 meters (49.2 feet) away from other objects.

- To prevent the recurrence of high-voltage battery fires, perform the following steps (1 to 3).

1. Completely shut off the vehicle (see 64).
2. Remove the service plug or interlock connector from the high voltage battery.
3. Discharge the high-voltage battery.
 - (1) Place the high-voltage battery in a saltwater immersion container.
 - (2) Add water until the high-voltage battery is completely submerged.
 - (3) In a bucket of water, add the amount of salt required to make the water in the saltwater immersion container a 1% solution, and then mix well.
 - (4) Pour the saltwater solution into the saltwater immersion container.
 - (5) Leave as is for 24 hours or more until the discharge is completed.

WARNING

- If gas bubbles are present, do not cover with a lid as the discharge may still be continuing.
- Electrolysis may generate large amounts of combustible hydrogen gas in the salt water. Make sure to perform the discharge operation without a lid.
- To ensure that all energy is discharged, make sure to let the discharge operation continue for at least 24 hours.
- During the discharge operation, there is a chance that a person could unknowingly touch the high-voltage battery, possibly resulting in serious injury or death due to electric shock. (P.152)

Vehicle with Hydrogen Gas

- In addition to the normal procedures, remove the service plug, etc. cutting off high voltage from the fuel cell (FC stack) before storing the vehicle.

WARNING

- Service plug, etc. cutting off high voltage is a high voltage component. Touching these without wearing protective equipment may result in serious injury or death from severe burns or electric shock. Wear appropriate protective equipment such as insulated gloves when touching high voltage components.
- To prevent serious injury or death from severe burns or electric shock, avoid touching, cutting, or breaching any orange high voltage power cable or high voltage component. Wear appropriate protective equipment such as insulated gloves when there is a risk of touching high voltage power cables or high voltage components.
- When the person(s) in charge of handling the damaged vehicle are away from the vehicle and someone else accidentally approaches or touches the vehicle, death or serious injury may occur due to electrocution, a rupture, an explosion or fire. To avoid this danger, display "HIGH VOLTAGE DO NOT TOUCH" and "HIGHPRESSURE GAS DO NOT TOUCH" signs to warn others (print and use page 12 and 15 of this guide).

NOTICE

- Vehicles that are equipped with hydrogen gas may leak due to damage incurred during an accident. The remaining hydrogen may ignite causing a fire or explosion. Therefore, when storing a vehicle equipped with hydrogen gas, place it in a well ventilated area 15 meters or more away from other items and leave the windows or doors open.

Vehicle with Sub-battery

NOTICE

- Due to the impact during the collision and electrolytic corrosion of the sub-battery, a short circuit may occur internally causing a fire to occur after a certain amount of time elapses. When storing a vehicle equipped with a sub-battery, place it in a well ventilated area 15 meters or more away from other items.

Components Requiring Special Attention

- The construction and functions of components requiring special attention during emergency response are described in this section.

SRS Airbags

- When a vehicle receives a strong impact that can cause serious injury to the occupants, the SRS airbags deploy and the seatbelts restrain the occupants to help reduce impact to the body. Refer to the Rescue Sheet for each model for the type and location of each SRS airbag.

*1	Driver Airbag	*2	Passenger Airbag
*3	Front Knee Airbag	*4	Front Seat Side Airbag
*5	Front Seat Cushion Airbag	*6	Curtain Shield Airbag
*7	Rear Seat Side Airbag	*8	Rear Seat Cushion Airbag
*9	Back Window Curtain Shield Airbag	*10	Front Seat Center Airbag

- The SRS airbags consist of an inflator (explosive), a bag and other components and are nonserviceable.
- When an airbag sensor detects a strong impact, an ignition signal is sent to an inflator. When the inflator is ignited, gas is generated to inflate a bag, helping reduce the impact to an occupant.

WARNING

- The SRS airbag may remain powered for up to 90 seconds after the vehicle is shut off and disabled (see page 64). Wait at least 90 seconds before starting any operation. Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from unintentional deployment of the SRS airbag.
- Depending on the circumstances surrounding a collision, such as vehicle speed, point of impact, occupant detection etc., SRS airbags will not always be deployed. If an inflator of the undeployed SRS airbag is breached, the powder inside the inflator may ignite resulting in unintentional SRS airbag deployment. To prevent serious injury or death from unintentional SRS airbag deployment, avoid breaching the inflators.
- Immediately after an SRS airbag is deployed, the components are extremely hot and may cause burns if touched.
- If an SRS airbag deploys with all doors and windows closed, inflation gas may cause breathing difficulty.
- If residue that is produced during SRS airbag deployment comes in contact with skin, rinse it off immediately to prevent skin irritation.

Driver Airbag

- A driver airbag is mounted in the steering wheel pad and activated in the event of a frontal collision.

*A	A-A Cross Section		
*1	Driver Airbag	*2	Inflator
*3	Bag		

Passenger Airbag

■ A passenger airbag is mounted in the upper portion of the passenger side instrument panel and activated in the event of a frontal collision.

*A	A-A Cross Section		
*1	Passenger Airbag	*2	Bag
*3	Inflator		

Front Knee Airbag

- Front knee airbags are mounted in the lower portion of the instrument panel on the driver side and the front passenger side, and activated in the event of a frontal collision.

*A	A-A Cross Section		
*1	Front Knee Airbag	*2	Bag
*3	Inflator		

Front Seat Side Airbag

- Front seat side airbags are mounted in the seat frame of the driver seat and the front passenger seat, and activated in the event of a side collision.
- In some vehicles, front seat side airbags are also activated in the event of a frontal collision.

*A	A-A Cross Section	*B	B-B Cross Section
*1	Front Seat Side Airbag	*2	Seat Frame
*3	Inflator	*4	Bag

Front Seat Center Airbag

- Front seat center airbags are mounted in the seat frame of the driver seat and the front passenger seat, and activated in the event of a side collision.

*A	A-A Cross Section	*B	B-B Cross Section
*1	Front Seat Center Airbag	*2	Seat Frame
*3	Inflator	*4	Bag

Front Seat Cushion Airbag

- Front seat cushion airbags are mounted in the seat cushion of the driver seat and the front passenger seat, and activated in the event of a frontal collision.

*A	A-A Cross Section		
*1	Front Seat Cushion Airbag	*2	Seat Cushion
*3	Inflator	*4	Bag

Curtain Shield Airbag

- Curtain shield airbags are mounted in the area between the front pillar and rear pillar on the driver side and the front passenger side, and activated in the event of a side collision.
- In some vehicles, curtain shield airbags are also activated in the event of a frontal collision.

*A	A-A Cross Section		
*1	Curtain Shield Airbag	*2	Front Pillar
*3	Rear Pillar	*4	Bag
*5	Inflator		

Rear Seat Side Airbag

- Rear seat side airbags are mounted in the sides of the rear seat frame or rear seat side garnish and activated in the event of a side collision.
- In some vehicles, rear seat side airbags are also activated in the event of a frontal collision.

*A	A-A Cross Section	*B	B-B Cross Section
*C	C-C Cross Section	*D	D-D Cross Section
*1	Rear Seat Side Airbag	*2	Rear Seat Frame
*3	Bag	*4	Inflator
*5	Rear Seat		
*a	Mounted in the Side of the Rear Seat Frame	*b	Mounted in the Rear Seat Side Garnish

Rear Seat Cushion Airbag

■ Rear seat cushion airbags are mounted in the rear seat cushions and activated in the event of a frontal collision.

*A	A-A Cross Section		
*1	Rear Seat Cushion Airbag	*2	Rear Seat Cushion
*3	Bag	*4	Inflator

Back Window Curtain Shield Airbag

■ A back window curtain shield airbag is mounted in the upper portion of the rear back panel (back door mounting section) and activated in the event of a rear collision.

*1	Back Window Curtain Shield Airbag	*2	Rear Back Panel
*3	Inflator	*4	Bag

Automatic rollover protection system

- If the vehicle rolls over, an automatic rollover protection system is deployed to ensure space between the ground and vehicle.
- The automatic rollover protection system is a non-disassembly type and is composed of parts such as the squib, ratchet, and center profile.
- When the airbag ECU detects a vehicle collision or rollover, the squib is ignited and the automatic rollover protection system begins operating. When the squib is ignited, the center profile and ratchet are unlocked, and the center profile moves upward.

*1	Center Profile	*2	Squib
*3	Ratchet		

Seat belt pretensioner

- When the vehicle receives a strong impact from the front, the seatbelts are retracted to optimally restrain the occupants.
- In some vehicles, seat belt pretensioners are also activated in the event of a side collision.

- A pretensioner mechanism is built into the retractor of each of the front seatbelts. Some models have a seat belt pretensioner mechanism in the rear seatbelts.
- The pretensioner mechanism consists of a gas generator, a piston and a pinion gear.
- When an airbag sensor detects a strong impact, an ignition signal is sent to a gas generator. When the gas generator is ignited, gas is generated and its pressure rotates a gear that retracts the seatbelt.

*1	Front Seatbelt	*2	Rear Seatbelt
*3	Retractor		

■ Refer to the Rescue Sheet for each model for locations of the seatbelt pretensioners.

- The seat belt pretensioners may remain powered for up to 90 seconds after the vehicle is shut off and disabled (see page 64). Wait at least 90 seconds before starting any operation. Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from unintentional actuation of the seat belt pretensioner
- To prevent serious injury or death from unintentional seat belt pretensioners actuation, avoid breaching the seat belt pretensioners.

Pedestrian protection active system

- During a frontal collision, the pedestrian protection active system lifts the entire hood or the rear end, ensuring ample space inside the engine room and contributing to reduced collision impact to the head of pedestrians.
- When the sensor inside the front bumper detects a strong impact, an ignition signal is sent to the inflator. When the inflator is ignited, the piston inside the lifter is pushed up, lifting the hood.

*A	Before Activation	*B	After Activation
*1	Hood	*2	Sensor
*3	Lifter	*4	Case
*5	Inflator	*6	Piston
*7	Gas		

WARNING

- The pedestrian protection active system may remain powered for up to 90 seconds after the vehicle is shut off and disabled (see page 64). Wait at least 90 seconds before starting any operation. Failure to shut off and disable the vehicle before emergency response procedures are performed may result in serious injury or death from unintentional actuation of the pedestrian protection active system.
- If a lifter is cut, the pedestrian protection active system inflator may unintentionally deploy. To prevent serious injury or death from unintentional pedestrian protection active system actuation, avoid breaching the lifters.
- If the hood release lever is pulled after the pedestrian protection active system is activated, the hood may rise more, possibly resulting in an injury.
- After the pedestrian protection active system is activated, the hood cannot be lowered by hand. If the hood is pushed down excessively, it may be deformed, possibly resulting in an injury.
- Immediately after the pedestrian protection active system is activated, the lifters are very hot and may cause burns if touched.

Gas strut / Preloaded spring

- Gas struts are used in various components, such as in the suspension (shock absorbers), engine hood stays, and for other various purposes. Nitrogen (N₂) gas is used in these dampers.
- Nitrogen (N₂) gas is colorless, odorless and harmless.
- Refer to the Rescue Sheet for each model for the location of these gas struts.

- If a gas-filled damper is heated in an event of a vehicle fire, the damper may explode due to expanded nitrogen (N₂) gas, possibly causing an injury.
- If a gas-filled damper is cut, nitrogen (N₂) gas may cause metal shavings from the cut to scatter. Wear appropriate safety gear such as safety glasses when cutting a gas-filled damper.

Front and Rear Suspension Dampers

- Suspension dampers are installed in the front and the rear suspension.

*1	Front Suspension Damper	*2	Rear Suspension Damper
----	-------------------------	----	------------------------

Engine Hood Damper

■ Gas struts are installed as the stays for the engine hood.

*1	Engine Hood Damper
----	--------------------

Luggage Compartment, Hatchback Door, Back Door Dampers

■ Gas struts are installed as the stays for the luggage compartment, the hatchback door and the back door.

*1	Luggage Compartment Damper	*2	Hatchback Door Damper
*3	Back Door Damper		

Performance Damper

- Performance dampers are installed across the front and the rear suspension towers and between the right and left sides of the rear lower structural frame (near the rear bumper).

*1	Performance Damper
----	--------------------

Tail Gate Damper, Side Gate Damper

- Gas struts are installed as the stays for the tail gate and side gate.

*1	Tail Gate Damper	*2	Side Gate Damper
----	------------------	----	------------------

Seat Damper

- Seat dampers are equipped to the lower surface of the seat.
